DECLARATION RELATING TO DISPOSITION OF PROJECT REPORT/THESIS

This is to certify that I AUNG MYINT being a candidate for the degree of MASTER OF ENGINEERING am fully aware of the policy of the University relating to the retention and use of higher degree project reports and theses, namely that the University retains the copies submitted for examination and is free to allow them to be consulted or borrowed. Subject to the provisions of the Copyright Act, 1968, the University may issue a project report or thesis in whole or in part, in photostat or microfilm or other copying medium.

In the light of these provisions I grant the University Librarian permission to publish, or to authorize the publication of my project report/thesis, in whole or in part.

I also authorize the publication by University Microfilms of a 350 word abstract in *Dissertation Abstracts International* (applicable to doctorates only).

Signature.....

Witness.....

Date..... 23/12/88

CERTIFICATE OF ORIGINALITY

I hereby declare that this thesis is my own work and that, to the best of my knowledge and belief, it contains no material previously published or written by another person nor material which to a substantial extent has been accepted for the award of any other degree or diploma of a university or other institute of higher learning, except where due acknowledgement is made in the text of the thesis.

THREE-DIMENSIONAL, THREE-PHASE BLACK OIL RESERVOIR SIMULATION USING THE IMPES METHOD

by

Aung Myint, B.E. (Petroleum)

Supervisor: W.V. Pinczewski

A dissertation submitted to the Centre for Petroleum Engineering in partial fulfilment of the requirement for the Degree of Master of Engineering.

University of New South Wales

December, 1988.

DEDICATED TO MY PARENTS AND

MY WIFE, SAN SAN WAI

ACKNOWLEDGEMENTS

My thanks to Mark Stevenson, Ha Do, Malcom Somers for their friendship and assistance over the period of my research.

My thanks to Dr. H.A. Salisch for his encouragement and enthusiasm in helping to expand my research.

My thanks to Dr.J.R. Fanchi, Keplinger and Associates, Inc., Tulsa, Oklahoma, who sent me a copy of BOAST simulator program while completing my studies.

My sincere thanks to Professor Val Pinczewski for his patience and guidance, and his support of my endeavours.

My special thanks to Lynne for typing my thesis.

ABSTRACT

Reservoir simulation computer programs are an integral part of the modern petroleum engineering effort. Mathematical models are developed to describe the three-dimensional, multiphase flow in a black-oil reservoir, and converted to finite difference form. Then the subsequent linear algebraic systems are solved, and the results are evaluated. However, as anyone who has ever tried to develop a simulation program will testify, there is a big gulf between the basic theory and a working computer code. This paper has been devoted primarily to the programming aspects of the finite difference technique. Many of the program subroutines are suitable for use in other programs.

GOWSIM, GWSIM and WSIM are designed to be easy-to-use programs which are suited to simulation of primary depletion, pressure maintenance by water and/or gas injection, waterflooding, gas reservoir with active water drive, and single phase aquifer reservoir model. These simulators contain only an IMPES formulation with direct elimination (BAND) and line successive overrelaxation with additive corrections method (CLSOR). These simulators can function as an inexpensive tool for performing a variety of reservoir simulation problems.

CHAPTER 1: DERIVATION OF GENERAL FLOW EQUATIONS

Introduction

A numerical reservoir simulator is a computer program capable of solving the difference equations for flow in porous media. The difference equations are obtained by substituting Darcy's Law into the continuity equation for each phase. Darcy's Law is essentially the rate equation that describes the relationship between the flow rate and pressure gradient for single-phase flow in porous media; however, it has been extended to describe multiphase systems in reservoir engineering applications.

1.1 Darcy's Law

In 1856, Henry Darcy (1) proposed the concept of permeability that defines the ability of a rock to transmit fluid. Darcy's law states:

> "The rate of flow of a homogeneous fluid through a porous media is proportional to the pressure gradient and to the cross-sectional area normal to the direction of flow and inversely proportional to the viscosity of the fluid."

The differential form of the relationship is:

$$\vec{v}_p = -\frac{\overleftrightarrow{K}}{\mu_p}(\nabla p_p - \rho_p \nabla z) \qquad (1\text{-}1)$$

where

$\vec{v}_p$ - superficial phase velocity vector

$\overleftrightarrow{K}$ - absolute permeability tensor of the porous media

μ_p - phase viscosity

ρ_p - phase density

∇P_p - phase pressure gradient

z - elevation

The permeability tensor $(\overleftrightarrow{K})$ used in Eq.(1.1) must be determined experimentally. For most reservoir engineering evaluations, it is normally assumed that the reservoir co-ordinates are parallel to the principal axes of the permeability tensor, thus making permeability a diagonal tensor.

$$\overleftrightarrow{K} = \begin{bmatrix} K_x & & \\ & K_y & \\ & & K_z \end{bmatrix}$$

If $K_x = K_y = K_z$, the medium is said to be isotropic, otherwise it is anisotropic. A dimensional analysis of Eq.(1.1), yields

$$\frac{L}{T} = \frac{\overleftrightarrow{K}}{M/(LT)} \cdot \frac{M}{L^2T^2} = \frac{\overleftrightarrow{K}}{LT}$$

$$\overleftrightarrow{K} = L^2 \qquad (1.2)$$

Eq.(1.2) shows that the unit of permeability is $(\text{length})^2$.

1.2 Mathematical Model for Three-Dimensional, Three-Phase Flow

To construct a mathematical model for reservoir simulation, we have to formulate first the mathematical equations which govern flow of fluid within porous media, using the physical laws that apply. These governing equations form the basic building blocks of a numerical simulator and are developed by combining the following:

1. Conservation of mass.
2. Rate equation (Darcy's Law).
3. Equation of state.

Conservation of Mass

Consider the simultaneous flow of three immiscible phases (gas, oil and water) each of which contains N chemical components in a single reservoir element (Fig. 1.1). Three phases are flowing into and out of the element in the x, y and z directions.

Let C_{ip} be the mass fractions of the ith component in the gas, oil and water phases, where 'i' implies component and 'p' implies phase. Applying the Law of Conservation of Mass to the ith component, we have during an interval Δt:

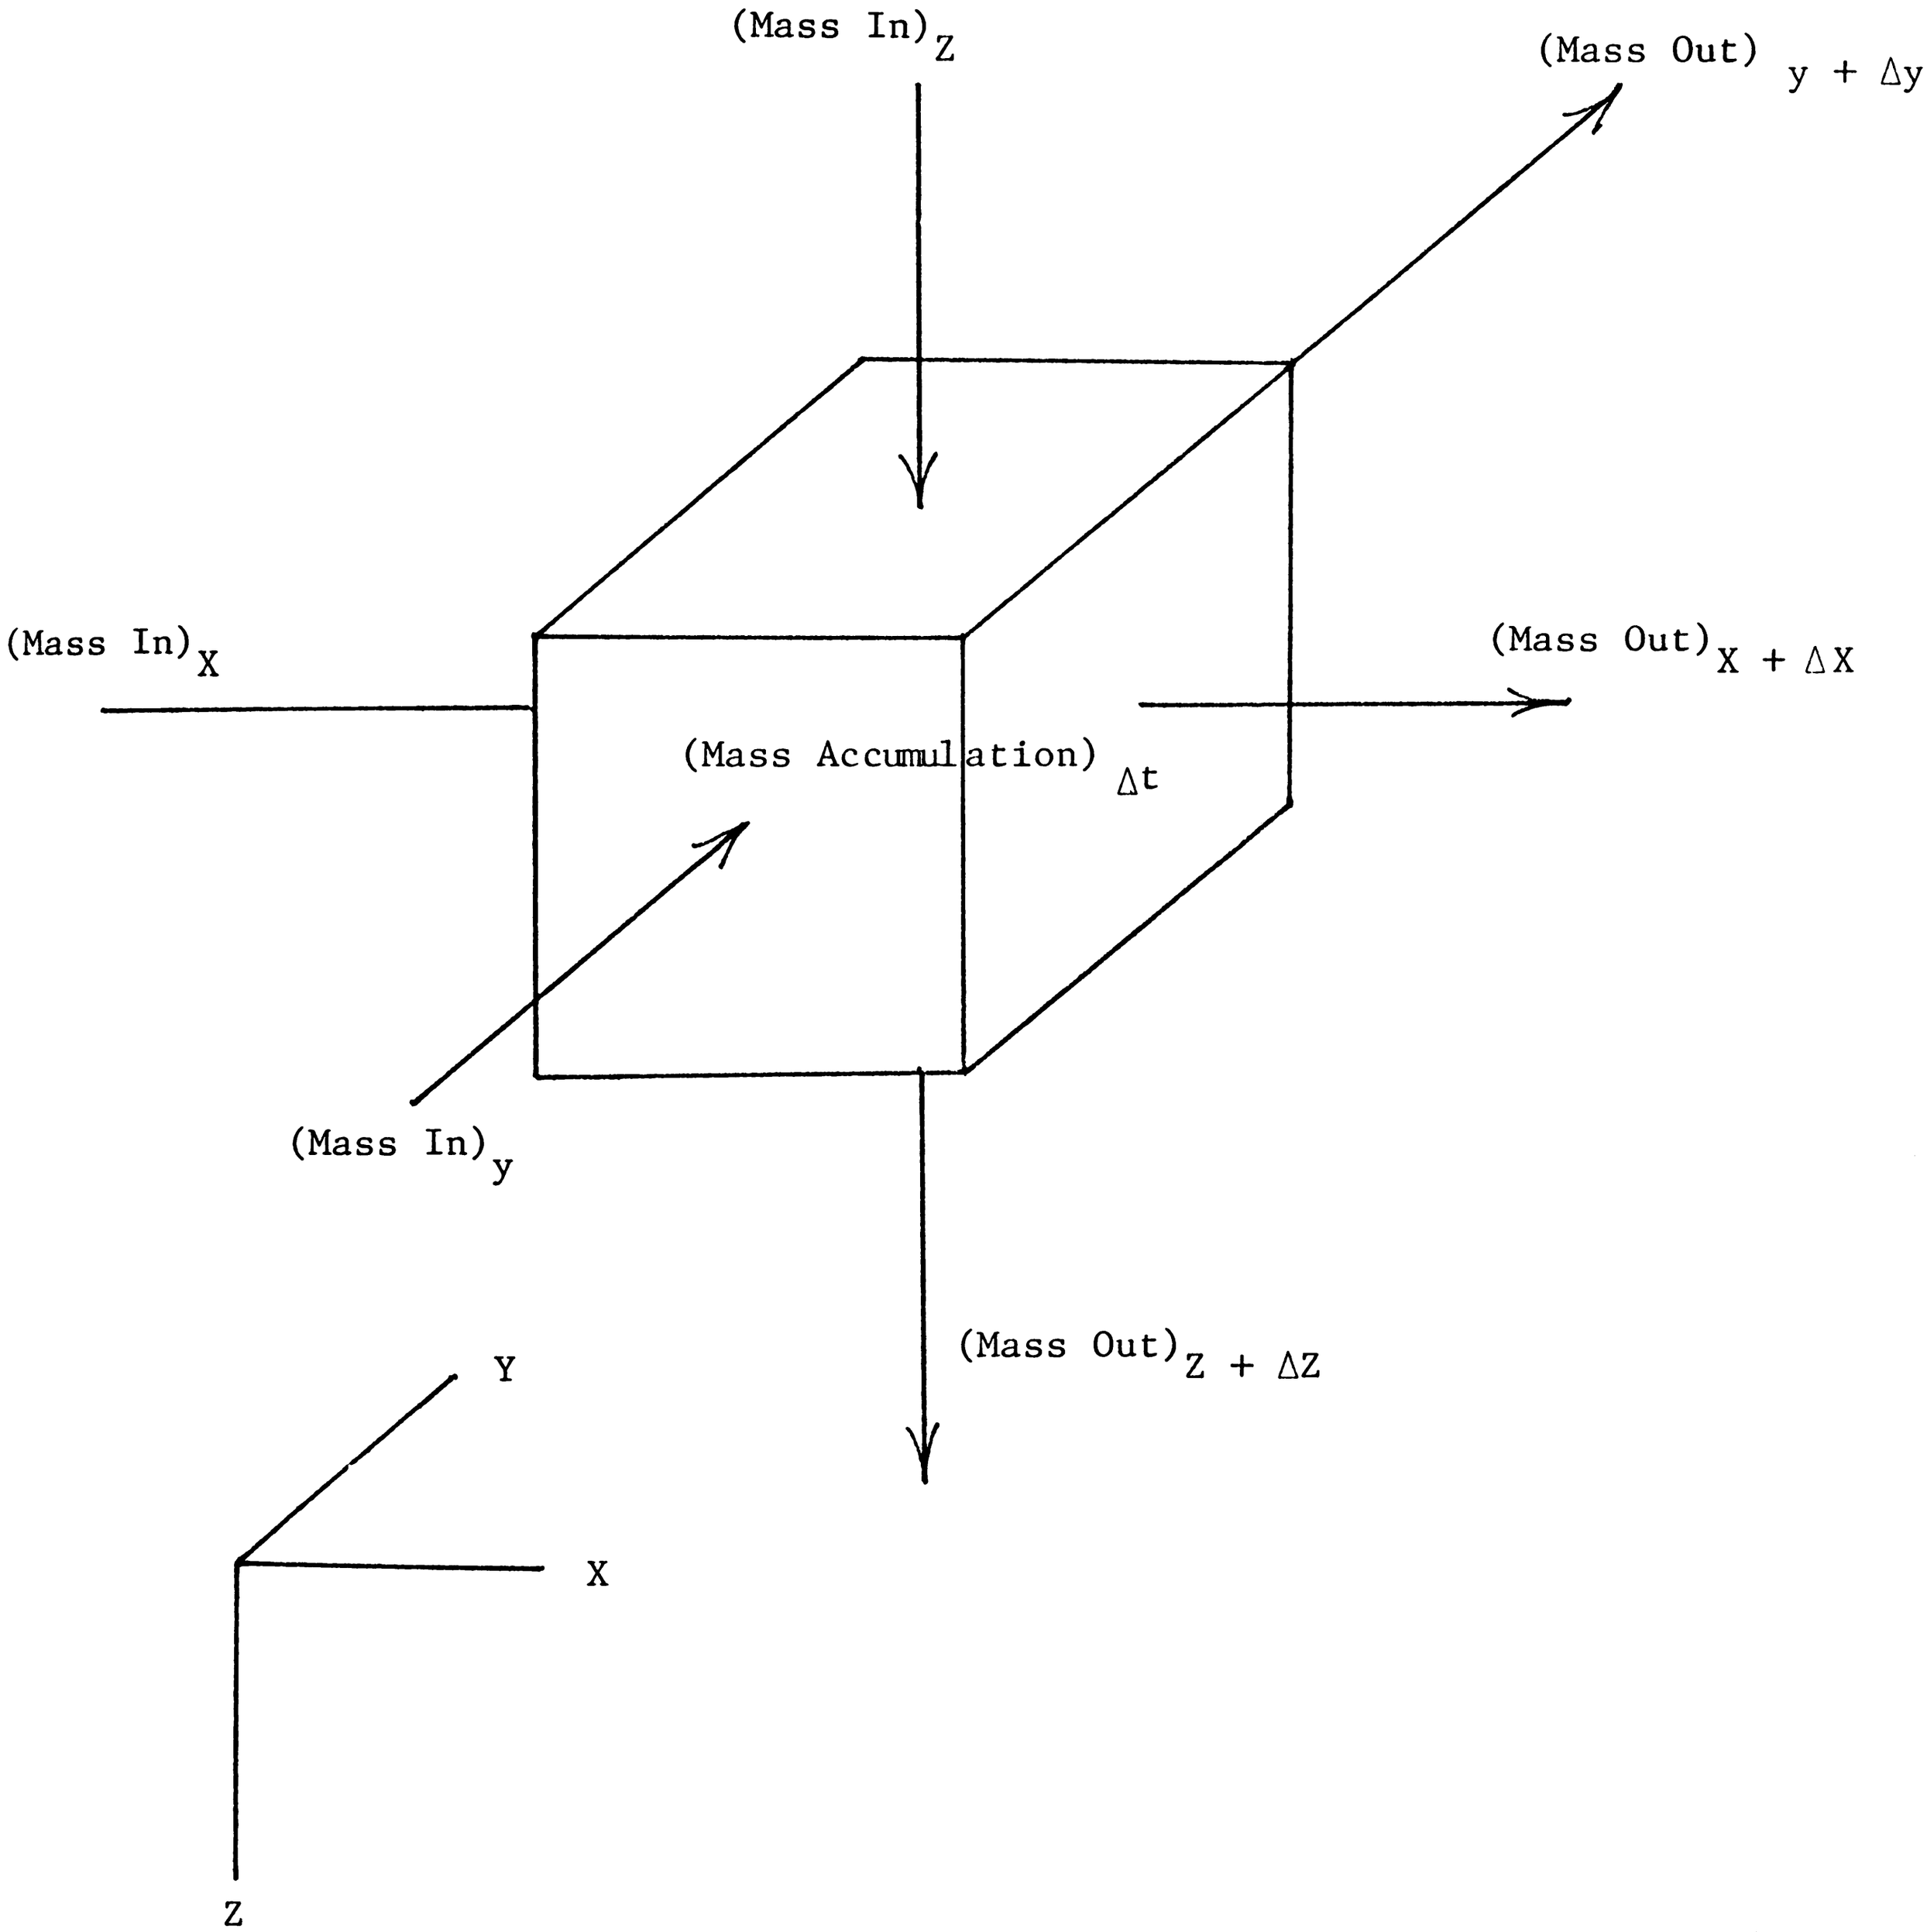
Mass in	Mass out	Mass accumulation
of Component 'i'	− of component 'i'	= of component 'i' in reservoir element ...(1.3)

Mass In

$$\left(C_{ig}\rho_g v_{gx} + C_{io}\rho_o v_{ox} + C_{i\omega}\rho_\omega v_{\omega x}\right)_x \Delta y \Delta z \Delta t +$$

$$\left(C_{ig}\rho_g v_{gy} + C_{io}\rho_o v_{oy} + C_{i\omega}\rho_\omega v_{\omega y}\right)_y \Delta x \Delta z \Delta t +$$

$$\left(C_{ig}\rho_g v_{gz} + C_{io}\rho_o v_{oz} + C_{i\omega}\rho_\omega v_{\omega z}\right)_z \Delta x \Delta y \Delta t \quad . \quad . \quad (1\text{-}4)$$



(Mass In)Z

Y
X
Z

FIGURE (1.1)

where

C_{ig} - mass fraction of component 'i' in gas phase

C_{io} - mass fraction of component 'i' in oil phase

C_{iw} - mass fraction of component 'i' in water phase

ρ_g - gas phase density

ρ_o - oil phase density

ρ_w - water phase density

Δx - length of reservoir element

Δy - width of reservoir element

Δz - thickness of reservoir element

Δt - incremental time interval

v_{gx} - x-direction component of gas phase velocity

v_{gy} - y-direction component of gas phase velocity

v_{gz} - z-direction component of gas phase velocity

v_{ox} - x-direction component of oil phase velocity

v_{oy} - y-direction component of oil phase velocity

v_{wx} - x-direction component of water phase velocity

v_{wy} - y-direction component of water phase velocity

v_{wz} - z-direction component of water phase velocity

Mass Out

$$\left(C_{ig}\rho_g v_{gx} + C_{io}\rho_o v_{ox} + C_{i\omega}\rho_\omega v_{\omega x}\right)_{x+\Delta x} \Delta y \Delta z \Delta t +$$

$$\left(C_{ig}\rho_g v_{gy} + C_{io}\rho_o v_{oy} + C_{i\omega}\rho_\omega v_{\omega y}\right)_{y+\Delta y} \Delta x \Delta z \Delta t +$$

$$\left(C_{ig}\rho_g v_{gz} + C_{io}\rho_o v_{oz} + C_{i\omega}\rho_\omega v_{\omega z}\right)_{z+\Delta z} \Delta x \Delta y \Delta t +$$

$$q_i \Delta x \Delta y \Delta z \Delta t \quad . \quad . \quad . \quad . \quad . \quad . \quad (1\text{-}5)$$

In Eq.(1.5) we have added a source or sink (injection or production) term q_i, which equals the mass rate of production of the ith component per unit volume of reservoir element. A negative q_i implies injection.

Mass Accumulation

$$\left\{\left(\phi C_{ig}\rho_g S_g + \phi C_{io}\rho_o S_o + \phi C_{i\omega}\rho_\omega S_\omega\right)_{t+\Delta t} - \left(\phi C_{ig}\rho_g S_g + \phi C_{io}\rho_o S_o + \phi C_{i\omega}\rho_\omega S_\omega\right)_t\right\} \Delta x \Delta y \Delta z \quad . \quad . \quad . \quad (1\text{-}6)$$

First combining Eqs.(1.4), (1.5) and (1.6); then dividing it by $\Delta x\Delta y\Delta z\Delta t$ and rearranging gives:

$$-\frac{1}{\Delta x}\left\{\left(C_{ig}\rho_g v_{gx}+C_{io}\rho_o v_{ox}+C_{i\omega}\rho_\omega v_{\omega x}\right)_{x+\Delta x}-\right.$$

$$\left.\left(C_{ig}\rho_g v_{gx}+C_{io}\rho_o v_{ox}+C_{i\omega}\rho_\omega v_{\omega x}\right)_x\right\}-$$

$$\frac{1}{\Delta y}\left\{\left(C_{ig}\rho_g v_{gy}+C_{io}\rho_o v_{oy}+C_{i\omega}\rho_\omega v_{\omega y}\right)_{y+\Delta y}-\right.$$

$$\left.\left(C_{ig}\rho_g v_{gy}+C_{io}\rho_o v_{oy}+C_{i\omega}\rho_\omega v_{\omega y}\right)_y\right\}-$$

$$\frac{1}{\Delta z}\left\{\left(C_{ig}\rho_g v_{gz}+C_{io}\rho_o v_{oz}+C_{i\omega}\rho_\omega v_{\omega z}\right)_{z+\Delta z}-\right.$$

$$\left.\left(C_{ig}\rho_g v_{gz}+C_{io}\rho_o v_{oz}+C_{i\omega}\rho_\omega v_{\omega z}\right)_z\right\}-q_i=$$

$$\frac{1}{\Delta t}\left\{\phi\left(C_{ig}\rho_g S_g+C_{io}\rho_o S_o+C_{i\omega}\rho_\omega S_\omega\right)_{t+\Delta t}-\right.$$

$$\left.\phi\left(C_{ig}\rho_g S_g+C_{io}\rho_o S_o+C_{i\omega}\rho_\omega S_\omega\right)_t\right\} \quad . \quad . \quad . \quad . \quad . \quad (1\_7)$$

where

ϕ = porosity

S_g, S_o, S_w = gas, oil and water phase saturations respectively.

In the limit as Δx, Δy, Δz and Δt tend to zero, Eq.(1.7) becomes:

$$-\frac{\partial}{\partial x}\left(C_{ig}\rho_g v_{gx}+C_{io}\rho_o v_{ox}+C_{i\omega}\rho_\omega v_{\omega x}\right)-\frac{\partial}{\partial y}\left(C_{ig}\rho_g v_{gy}+C_{io}\rho_o v_{oy}+C_{i\omega}\rho_\omega v_{\omega y}\right)$$

$$-\frac{\partial}{\partial z}\left(C_{ig}\rho_g v_{gz}+C_{io}\rho_o v_{oz}+C_{i\omega}\rho_\omega v_{\omega z}\right)-q_i =$$

$$\frac{\partial}{\partial t}\left\{\phi\left(C_{ig}\rho_g S_g+C_{io}\rho_o S_o+C_{i\omega}\rho_\omega S_\omega\right)\right\} \quad . \quad . \quad . \quad . \quad (1\text{-}8)$$

Introducing the notation of divergence (2),

$$\mathrm{div}\left(C_{ig}\rho_g\vec{v}_g+C_{io}\rho_o\vec{v}_o+C_{i\omega}\rho_\omega\vec{v}_\omega\right)$$

$$=\nabla\cdot\left(C_{ig}\rho_g\vec{v}_g+C_{io}\rho_o\vec{v}_o+C_{i\omega}\rho_\omega\vec{v}_\omega\right)$$

$$=\left(\frac{\partial}{\partial x}\vec{i}+\frac{\partial}{\partial y}\vec{j}+\frac{\partial}{\partial z}\vec{k}\right)\cdot\left(C_{ig}\rho_g\vec{v}_g+C_{io}\rho_o\vec{v}_o+C_{i\omega}\rho_\omega\vec{v}_\omega\right)$$

$$=\left(\frac{\partial}{\partial x}\vec{i}+\frac{\partial}{\partial y}\vec{j}+\frac{\partial}{\partial z}\vec{k}\right)\cdot\left(C_{ig}\rho_g v_{gx}\vec{i}+C_{ig}\rho_g v_{gy}\vec{j}+C_{ig}\rho_g v_{gz}\vec{k}+\right.$$

$$C_{io}\rho_o v_{ox}\vec{i}+C_{io}\rho_o v_{oy}\vec{j}+C_{io}\rho_o v_{oz}\vec{k}+C_{i\omega}\rho_\omega v_{\omega x}\vec{i}+C_{i\omega}\rho_\omega v_{\omega y}\vec{j}+$$

$$\left.C_{i\omega}\rho_\omega v_{\omega z}\vec{k}\right)$$

$$=\frac{\partial}{\partial x}\left(C_{ig}\rho_g v_{gx}+C_{io}\rho_o v_{ox}+C_{i\omega}\rho_\omega v_{\omega x}\right)+$$

$$\frac{\partial}{\partial y}\left(C_{ig}\rho_g v_{gy}+C_{io}\rho_o v_{oy}+C_{i\omega}\rho_\omega v_{\omega y}\right)+$$

$$\frac{\partial}{\partial z}\left(C_{ig}\rho_g v_{gz}+C_{io}\rho_o v_{oz}+C_{i\omega}\rho_\omega v_{\omega z}\right) \quad . \quad . \quad . \quad (1\text{-}9)$$

Equating Eqs.(1.8) and (1.9), we obtain the "continuity equation".

$$-\nabla\cdot\left(C_{ig}\rho_g\vec{v}_g + C_{io}\rho_o\vec{v}_o + C_{i\omega}\rho_\omega\vec{v}_\omega\right) - q_i =$$

$$\frac{\partial}{\partial t}\left\{\phi\left(C_{ig}\rho_g S_g + C_{io}\rho_o S_o + C_{i\omega}\rho_\omega S_\omega\right)\right\} \quad \ldots \quad (1\text{-}10)$$

Rate Equation

Darcy's Law for multiphase flow is:

$$\vec{v}_p = -\frac{(K_e)_p}{\mu_p}\left(\nabla P_p - \rho_p \nabla z\right) \quad \ldots \quad (1\text{-}11)$$

where

$(K_e)_p$ - effective permeability of rock to fluid 'p' when more than one fluid is flowing.

Substitution of v_p in Eq.(1.10) gives:

$$\nabla.\left\{\frac{C_{ig}\rho_g(K_e)_g}{\mu_g}(\nabla P_g-\rho_g\nabla z)+\frac{C_{io}\rho_o(K_e)_o}{\mu_o}(\nabla P_o-\rho_o\nabla z)\right.$$

$$\left.+\frac{C_{i\omega}\rho_\omega(K_e)_\omega}{\mu_\omega}(\nabla P_\omega-\rho_\omega\nabla z)\right\}-q_i=$$

$$\frac{\partial}{\partial t}\left\{\phi(C_{ig}\rho_g S_g+C_{io}\rho_o S_o+C_{i\omega}\rho_\omega S_\omega)\right\} \quad . \quad . \quad . \quad (1\text{-}12)$$

1.3 Relative Permeability Phenomena

When more than one fluid flows through a porous media, the fluids interfere with each other and each fluid experiences effective permeability lower than that if it alone occupied the pore space. The relative permeability is defined as:

$$k_{rp}=\frac{(K_e)_p}{\overleftrightarrow{K}}\leqslant 1 \quad . \quad . \quad . \quad . \quad (1\text{-}13)$$

where

$\overleftrightarrow{K}$ = absolute phase permeability and is a function of fluid saturation.

Substituting $(K_e)_p$ in Eq. (1.12), we obtain

$$\nabla\cdot\left\{\frac{c_{ig}\rho_g\overleftrightarrow{K}k_{rg}}{\mu_g}(\nabla P_g-\rho_g\nabla z)+\frac{c_{io}\rho_o\overleftrightarrow{K}k_{ro}}{\mu_o}(\nabla P_o-\rho_o\nabla z)\right.$$

$$\left.+\frac{c_{iw}\rho_w\overleftrightarrow{K}k_{rw}}{\mu_w}(\nabla P_w-\rho_w\nabla z)\right\}-q_i=$$

$$\frac{\partial}{\partial t}\left\{\phi(c_{ig}\rho_g S_g+c_{io}\rho_o S_o+c_{iw}\rho_w S_w)\right\} \quad . \quad . \quad . \quad (1\text{-}14)$$

1.4 Black-Oil Reservoir Simulator

Most reservoir simulators are classified into three general groups according to the type of reservoir they are intended to simulate. They are gas reservoir simulators, black-oil reservoir simulators and compositional reservoir simulators. Gas reservoir simulators may be either single-phase or two-phase models depending on whether or not mobile water is present.

A black-oil reservoir simulator, on the other hand, is capable of simulating those systems where gas, oil and water are all present. Usually, mass transfer is accounted for between the gas and oil phases. This chapter provides detailed information concerning the development of a three-dimensional, three-phase black oil simulator. The formulation is then modified to model a two-phase gas reservoir, and also a simple single phase aquifer model.

For the black-oil model we assume that the oil phase consists of only two components, the dissolved gas and the residual or black oil that remains when the gas is liberated from solution. We make assumptions that no mass transfers occur between the oil and water phases. Gas is assumed to be soluble in both oil and water. A one-way phase transfer occurs between the gas and oil and also between the gas and water. This means the gas phase can be transported both in the oil and water phaes but the oil and water do not vaporize into the gas phase. These assumptions lead to the following conditions.

	Gas Phase	Oil Phase	Water Phase
Gas Component	$C_{gg} = 1$	$C_{go} = \frac{m_g}{m_g + m_o}$	$C_{g\omega} = \frac{m_g}{m_g + m_\omega}$
Oil Component	$C_{og} = 0$	$C_{oo} = \frac{m_o}{m_g + m_o}$	$C_{o\omega} = 0$
Water Component	$C_{\omega g} = 0$	$C_{\omega o} = 0$	$C_{\omega\omega} = \frac{m_\omega}{m_g + m_\omega}$

where (1-15)

m_g, m_o, m_w - masses of gas, oil and water phases respectively.

Formation Volume Factors

The Oil formation volume factor (B_o) is defined as:

$$B_o = \frac{V_o}{V_{osc}} \quad . \quad . \quad . \quad . \quad . \quad (1\text{-}16)$$

where

V_o - oil volume containing dissolved gas at reservoir conditions

V_{osc} - dead oil volume at standard conditions

Since $\rho_{osc} = \frac{m_o}{V_{osc}}$, $\rho_o = \frac{m_g + m_o}{V_o}$; then

$$B_o = \frac{m_g + m_o}{\rho_o} \cdot \frac{\rho_{osc}}{m_o}$$

$$\text{or} \quad \frac{m_o}{m_g + m_o} = C_{oo} = \frac{\rho_{osc}}{\rho_o B_o} \quad . \quad . \quad . \quad (1\text{-}17)$$

where

ρ_o = reservoir oil density

ρ_{osc} = dead oil density at standard conditions

Similarly we can show that

$$C_{\omega\omega} = \frac{\rho_{\omega sc}}{\rho_\omega B_\omega} \quad . \quad . \quad . \quad . \quad (1\text{-}18)$$

where

ρ_{wsc} = water density at standard conditions

ρ_w = water density at reservoir conditions

ρ_w = water formation volume factor

Solution Gas-Oil Ratio

Solution gas-oil ratio (R_{so}) is defined as:

$$R_{so} = \frac{V_{gsc}}{V_{osc}} \quad , \quad \text{or}$$

$$R_{so} = \frac{m_g/\rho_{gsc}}{m_o/\rho_{osc}} = \frac{m_g \rho_{osc}}{m_o \rho_{gsc}} \quad . \quad . \quad . \quad . \quad (1\text{-}19)$$

Now we calculate for

$$C_{go} = \frac{m_g}{m_g + m_o} = \frac{m_o}{m_g + m_o} \cdot \frac{m_g}{m_o}$$

$$= C_{oo} \frac{R_{so} \rho_{gsc}}{\rho_{osc}} \quad . \quad . \quad . \quad . \quad (1\text{-}20)$$

Subsitituting Eq.(1.17) for C_{oo} in Eq.(1.20), we get

$$C_{go} = \frac{\rho_{osc}}{\rho_o B_o} \cdot \frac{R_{so} \rho_{gsc}}{\rho_{osc}} = \frac{R_{so} \rho_{gsc}}{\rho_o B_o} \quad . \quad . \quad (1\text{-}21)$$

Similarly, we can show that

$$C_{g\omega} = \frac{R_{s\omega} \rho_{gsc}}{\rho_\omega B_\omega} \quad . \quad . \quad . \quad (1\text{-}22)$$

where

R_{sw} = solution gas-water ratio

Gas formation volume factor (B_g) is defined as:

$$B_g = \frac{V_g}{V_{gsc}} = \frac{m_g/\rho_g}{m_g/\rho_{gsc}} = \frac{\rho_{gsc}}{\rho_g} \quad \ldots \quad (1\text{-}23)$$

Now we have:

	Gas Phase	Oil Phase	Water Phase
Gas Component	$C_{gg} = 1$	$C_{go} = \frac{R_{so}\rho_{gsc}}{\rho_o B_o}$	$C_{g\omega} = \frac{R_{s\omega}\rho_{gsc}}{\rho_\omega B_\omega}$
Oil Component	$C_{og} = 0$	$C_{oo} = \frac{\rho_{osc}}{\rho_o B_o}$	$C_{o\omega} = 0$
Water Component	$C_{\omega g} = 0$	$C_{\omega o} = 0$	$C_{\omega\omega} = \frac{\rho_{\omega sc}}{\rho_\omega B_\omega}$

$$\ldots \quad (1\text{-}24)$$

From Eq.(1.14), we begin to derive oil equation first.

$$\nabla \cdot \left\{ \frac{\rho_{osc}\rho_o \overleftrightarrow{K} k_{ro}}{\rho_o B_o \mu_o} (\nabla P_o - \rho_o \nabla z) \right\} - q_o = \frac{\partial}{\partial t}\left(\frac{\phi \rho_{osc} \rho_o S_o}{\rho_o B_o} \right)$$

$$\ldots \quad (1\text{-}25)$$

Dividing Eq.(1.25) by ρ_{osc}, we get the <u>"oil equation"</u>.

$$\nabla.\left\{\frac{\overleftrightarrow{K}k_{ro}}{B_o\mu_o}(\nabla P_o - \varrho_o\nabla z)\right\} - \frac{q_o}{\varrho_{osc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_o}{B_o}\right) \quad . \quad . \qquad (1\text{-}26)$$

Similarly, we can have the <u>"water equation"</u> as:

$$\nabla.\left\{\frac{\overleftrightarrow{K}k_{r\omega}}{B_\omega\mu_\omega}(\nabla P_\omega - \varrho_\omega\nabla z)\right\} - \frac{q_\omega}{\varrho_{\omega sc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_\omega}{B_\omega}\right) \quad . \quad . \qquad (1\text{-}27)$$

Finally, the <u>"gas equation"</u> is:

$$\nabla.\left\{\frac{\varrho_{gsc}\overleftrightarrow{K}k_{rg}}{B_g\mu_g}(\nabla P_g - \varrho_g\nabla z) + \frac{R_{so}\varrho_{gsc}}{\varrho_o B_o}\frac{\varrho_o\overleftrightarrow{K}k_{ro}}{\mu_o}(\nabla P_o - \varrho_o\nabla z)\right.$$

$$\left. + \frac{R_{s\omega}\varrho_{gsc}}{\varrho_\omega B_\omega}\frac{\varrho_\omega\overleftrightarrow{K}k_{r\omega}}{\mu_\omega}(\nabla P_\omega - \varrho_\omega\nabla z)\right\} - q_g =$$

$$\frac{\partial}{\partial t}\left\{\phi\left(\frac{\varrho_{gsc}S_g}{B_g} + \frac{R_{so}\varrho_{gsc}}{\varrho_o B_o}\varrho_o S_o + \frac{R_{s\omega}\varrho_{gsc}}{\varrho_\omega B_\omega}\varrho_\omega S_\omega\right)\right\}$$

Dividing the above equation by ρ_{gsc}, we get

$$\nabla.\overleftrightarrow{K}\left\{\frac{k_{rg}}{B_g\mu_g}(\nabla P_g - \varrho_g\nabla z) + \frac{R_{so}k_{ro}}{B_o\mu_o}(\nabla P_o - \varrho_o\nabla z) + \frac{R_{sw}k_{rw}}{B_w\mu_w}(\nabla P_w - \varrho_w\nabla z)\right\} - \frac{q_g}{\varrho_{gsc}} =$$

$$\frac{\partial}{\partial t}\left\{\phi\left(\frac{S_g}{B_g} + \frac{R_{so}S_o}{B_o} + \frac{R_{sw}S_w}{B_w}\right)\right\} \quad . \quad . \quad . \quad (1\text{-}28)$$

Phase Mobility

Phase mobility (λ_p) is defined as:

$$\lambda_p = \frac{k_{rp}}{\mu_p} \quad . \quad . \quad . \quad . \quad . \quad (1\text{-}29)$$

k_{rp} = relative permeability

μ_p = phase viscosity

Substituting λ_p in Eqs.(1.26), (1.27) and (1.28) gives

Oil Equation

$$\nabla.\overleftrightarrow{K}\left\{\left(\frac{\lambda_o}{B_o}\right)\left(\nabla P_o - \rho_o \nabla z\right)\right\} - \frac{q_o}{\rho_{osc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_o}{B_o}\right) \quad . \quad . \quad (1\text{-}30)$$

Water Equation

$$\nabla.\overleftrightarrow{K}\left\{\left(\frac{\lambda_w}{B_w}\right)\left(\nabla P_w - \rho_w \nabla z\right)\right\} - \frac{q_w}{\rho_{wsc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_w}{B_w}\right) \quad . \quad . \quad (1\text{-}31)$$

Gas Equation

$$\nabla.\overleftrightarrow{K}\left\{\frac{\lambda_g}{B_g}\left(\nabla P_g - \rho_g \nabla z\right) + \frac{R_{so}\lambda_o}{B_o}\left(\nabla P_o - \rho_o \nabla z\right) + \frac{R_{sw}\lambda_w}{B_w}\left(\nabla P_w - \rho_w \nabla z\right)\right\} - \frac{q_g}{\rho_{gsc}} =$$

$$\frac{\partial}{\partial t}\left\{\phi\left(\frac{S_g}{B_g} + \frac{R_{so}S_o}{B_o} + \frac{R_{sw}S_w}{B_w}\right)\right\} \quad . \quad . \quad . \quad (1\text{-}32)$$

Capillary Pressures

Capillary pressure is defined as the difference in pressure between the wetting and non-wetting phases. Considering the wetting phase to be water and the non-wetting phase to be oil the oil-water capillary pressure may be written as:

$$P_{cow} = P_o - P_w \quad . \quad . \quad . \quad . \quad (1\_33)$$

and the gas-oil capillary pressure as

$$P_{cgo} = P_g - P_o \quad . \quad . \quad . \quad (1\_34)$$

Then $P_w = P_o - P_{cow}$ and

$$P_g = P_o + P_{cgo} \quad . \quad . \quad . \quad (1\_35)$$

Substitution of P_w and P_g in Eqs.(1.30), (1.31) and (1.32) gives

Oil Equation

$$\nabla.\overleftrightarrow{K}\left(\frac{\lambda_o}{B_o}\right)\left(\nabla P_o - \rho_o \nabla z\right) - \frac{q_o}{\rho_{osc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_o}{B_o}\right) \quad . \quad . \quad (1\text{-}36)$$

Let

$$CG_o = -\nabla.\overleftrightarrow{K}\left(\frac{\lambda_o}{B_o}\right)\rho_o \nabla z \quad . \quad . \quad . \quad (1\text{-}37)$$

Then Eq.(1.36) can be written in another form as:

$$\nabla.\overleftrightarrow{K}\left(\frac{\lambda_o}{B_o}\right)\nabla P_o + CG_o - \frac{q_o}{\rho_{osc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_o}{B_o}\right) \quad . \quad . \quad (1\text{-}38)$$

Water Equation

$$\nabla . \overleftrightarrow{K} \left(\frac{\lambda_\omega}{B_\omega} \right) \left(\nabla P_o - \nabla P_{cow} - \rho_\omega \nabla z \right) - \frac{q_\omega}{\rho_{\omega sc}}$$

$$= \frac{\partial}{\partial t} \left(\frac{\phi S_\omega}{B_\omega} \right) \qquad \ldots \ldots \qquad (1\text{-}39)$$

Let

$$CG_w = - \nabla . \overleftrightarrow{K} \left(\frac{\lambda_\omega}{B_\omega} \right) \left(\nabla P_{cow} + \rho_\omega \nabla z \right) \qquad \ldots \qquad (1\text{-}40)$$

The water equation becomes:

$$\nabla . \overleftrightarrow{K} \left(\frac{\lambda_\omega}{B_\omega} \right) \nabla P_o + CG_w - \frac{q_\omega}{\rho_{\omega sc}} = \frac{\partial}{\partial t} \left(\frac{\phi S_\omega}{B_\omega} \right) \qquad \ldots \qquad (1\text{-}41)$$

Gas Equation

$$\nabla.\overleftrightarrow{K}\left\{\frac{\lambda_g}{B_g}\left(\nabla P_o+\nabla P_{cgo}-\rho_g\nabla z\right)+\frac{R_{so}\lambda_o}{B_o}\left(\nabla P_o-\rho_o\nabla z\right)\right.$$

$$\left.+\frac{R_{sw}\lambda_w}{B_w}\left(\nabla P_o-\nabla P_{cow}-\rho_w\nabla z\right)\right\}-\frac{q_g}{\rho_{gsc}} =$$

$$\frac{\partial}{\partial t}\left\{\phi\left(\frac{S_g}{B_g}+\frac{R_{so}S_o}{B_o}+\frac{R_{sw}S_w}{B_w}\right)\right\} \quad . \quad . \quad . \quad (1\text{-}42)$$

$$\nabla.\overleftrightarrow{K}\left\{\left(\frac{\lambda_g}{B_g}+\frac{R_{so}\lambda_o}{B_o}+\frac{R_{sw}\lambda_w}{B_w}\right)\nabla P_o+\frac{\lambda_g}{B_g}\left(\nabla P_{cgo}-\rho_g\nabla z\right)\right.$$

$$\left.-\frac{R_{so}\lambda_o}{B_o}\rho_o\nabla z-\frac{R_{sw}\lambda_w}{B_w}\left(\nabla P_{cow}+\rho_w\nabla z\right)\right\}-\frac{q_g}{\rho_{gsc}}$$

$$=\frac{\partial}{\partial t}\left\{\phi\left(\frac{S_g}{B_g}+\frac{R_{so}S_o}{B_o}+\frac{R_{sw}S_w}{B_w}\right)\right\} \quad . \quad . \quad (1\text{-}43)$$

Let

$$CG_g = \nabla.\overleftrightarrow{K}\left\{\frac{\lambda_g}{B_g}\left(\nabla P_{cgo}-\rho_g\nabla z\right)-\frac{R_{so}\lambda_o}{B_o}\rho_o\nabla z\right.$$

$$\left.-\frac{R_{sw}\lambda_w}{B_w}\left(\nabla P_{cow}+\rho_w\nabla z\right)\right\} \quad . \quad . \quad . \quad (1\text{-}44)$$

Substituting CG_g in Eq.(1.43), we obtain:

$$\nabla.\overleftrightarrow{K}\left\{\left(\frac{\lambda_g}{B_g}+\frac{R_{so}\lambda_o}{B_o}+\frac{R_{sw}\lambda_w}{B_w}\right)\right\}\nabla P_o+CG_g$$

$$-\frac{q_g}{e_{gsc}}=\frac{\partial}{\partial t}\left\{\phi\left(\frac{S_g}{B_g}+\frac{R_{so}S_o}{B_o}+\frac{R_{sw}S_w}{B_w}\right)\right\} \quad . \quad . \quad . \quad . \quad (1\text{-}45)$$

1.5 Formulation of the IMPES Method

Having derived the governing equations for multiphase flow, we must now solve Eqs.(1.38), (1.41) and (1.45) to obtain the spatial distribution of pressure and saturation of each phase in the porous media. The two basic methods for solving multiphase equations are:

1. Simultaneous solution (SS) method.
2. Implicit pressure-explicit saturation (IMPES) method.

The essence of SS method will be discussed briefly because this study is directed at applying the IMPES method for solving the multiphase flow equations. In 1959, Douglas (3) first proposed a SS method that writes the saturation derivatives on the right hand sides of Eqs. (1.38), (1.41) and (1.45) in terms of the pressure derivatives and then solves the resulting equations simultaneously. The detailed discussion on SS method can be found in many reservoir simulation literatures (4, 5, 6, 7).

The IMPES method (8), on the other hand, combines the individual phase equations into a single, multiphase equation based on pressure, and then solves the pressure equation implicitly for the pressure distribution. After the pressure solution is obtained, the saturations are explicitly updated by substituting the results in the Eqs(1.38), (1.41). When S_o and S_w are known for new time level, the new capillary pressures are calculated, and then explicitly used at the next time step. The summary of IMPES method is shown in Figure (1.2).

In evaluating pressures from the pressure equation, a problem may arise: How can we determine the pressures if the solution of the equation depends on the calculation of phase mobilities which themselves depend on these pressures? We can get out of this dilemma by letting all pressure - and saturation - dependent terms lag behind the pressure terms. This is done by evaluating the mobilities and capillary pressures at the previous saturations and pressures. Implied in this approach is the assumption that the saturation and pressure values are not changing very rapidly. It is well justified in a large areal model study, for example, with well-distributed production and/ or injection rates.

Oil Equation

$$\nabla.\overleftrightarrow{K}\left(\frac{\lambda_o}{B_o}\right)\nabla P_o + CG_o - \frac{q_{lo}}{\rho_{osc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_o}{B_o}\right) \quad . \quad . \quad . \quad (1-48)$$

Water Equation

$$\nabla.\overleftrightarrow{K}\left(\frac{\lambda_w}{B_w}\right)\nabla P_o + CG_w - \frac{q_w}{\rho_{wsc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_w}{B_w}\right) \quad . \quad . \quad . \quad (1-49)$$

Gas Equation

$$\nabla.\overleftrightarrow{K}\left\{\left(\frac{\lambda_g}{B_g} + \frac{R_{so}\lambda_o}{B_o} + \frac{R_{sw}\lambda_w}{B_w}\right)\right\}\nabla P_o + CG_g$$

$$- \frac{q_g}{\rho_{gsc}} = \frac{\partial}{\partial t}\left\{\phi\left(\frac{S_g}{B_g} + \frac{R_{so}S_o}{B_o} + \frac{R_{sw}S_w}{B_w}\right)\right\} \quad . \quad . \quad . \quad (1-50)$$

Expanding the RHS of Eq.(1.48) and multiplying it by $(B_o - R_{so}B_g)$, we get

$$(B_o - R_{so}B_g)\left\{\frac{\phi}{B_o}\frac{\partial S_o}{\partial t} + \left(\frac{S_o}{B_o}\frac{\partial \phi}{\partial P_o} - \frac{S_o\phi}{B_o^2}\frac{\partial B_o}{\partial P_o}\right)\frac{\partial P_o}{\partial t}\right\}$$

$$= \phi\frac{\partial S_o}{\partial t} + \left(S_o\frac{\partial \phi}{\partial P_o} - \frac{S_o\phi}{B_o}\frac{\partial B_o}{\partial P_o}\right)\frac{\partial P_o}{\partial t} - \frac{R_{so}B_g\phi}{B_o}\frac{\partial S_o}{\partial t}$$

$$-\left(\frac{R_{so}B_gS_o}{B_o}\frac{\partial \phi}{\partial P_o} - \frac{R_{so}B_gS_o\phi}{B_o^2}\frac{\partial B_o}{\partial P_o}\right)\frac{\partial P_o}{\partial t} \quad \ldots \quad (1\_51)$$

Expanding the RHS of Eq.(1.49) and multiplying it by $(B_w - R_{sw}B_g)$, we get

$$(B_w - R_{sw}B_g)\left\{\frac{\phi}{B_w}\frac{\partial S_w}{\partial t} + \left(\frac{S_w}{B_w}\frac{\partial \phi}{\partial P_w} - \frac{S_w\phi}{B_w^2}\frac{\partial B_w}{\partial P_w}\right)\frac{\partial P_w}{\partial t}\right\}$$

$$= \phi\frac{\partial S_w}{\partial t} + \left(S_w\frac{\partial \phi}{\partial P_w} - \frac{S_w\phi}{B_w}\frac{\partial B_w}{\partial P_w}\right)\frac{\partial P_w}{\partial t} - \frac{R_{sw}B_g\phi}{B_w}\frac{\partial S_w}{\partial t}$$

$$-\left(\frac{R_{sw}B_gS_w}{B_w}\frac{\partial \phi}{\partial P_w} - \frac{R_{sw}B_gS_w\phi}{B_w^2}\frac{\partial B_w}{\partial P_w}\right)\frac{\partial P_w}{\partial t} \quad \ldots \quad (1\_52)$$

Expanding the RHS of Eq.(1.51) and multiplying it by B_g, we get

$$B_g\left\{\frac{\phi}{B_g}\frac{\partial S_g}{\partial t}+\left(\frac{S_g}{B_g}\frac{\partial\phi}{\partial P_g}-\frac{S_g\phi}{B_g^2}\frac{\partial B_g}{\partial P_g}\right)\frac{\partial P_g}{\partial t}+\left(\frac{R_{so}S_o}{B_o}\frac{\partial\phi}{\partial P_g}\right.\right.$$

$$+\frac{S_o\phi}{B_o}\frac{\partial R_{so}}{\partial P_g}-\frac{R_{so}S_o\phi}{B_o^2}\frac{\partial B_o}{\partial P_g}\Big)\frac{\partial P_g}{\partial t}+\frac{R_{sw}\phi}{B_w}\frac{\partial S_w}{\partial t}+$$

$$\left.\left(\frac{R_{sw}S_w}{B_w}\frac{\partial\phi}{\partial P_g}+\frac{S_w\phi}{B_w}\frac{\partial R_{sw}}{\partial P_g}-\frac{R_{sw}S_w\phi}{B_w^2}\frac{\partial B_w}{\partial P_g}\right)\frac{\partial P_g}{\partial t}\right\}$$

$$=\phi\frac{\partial S_g}{\partial t}+\left(S_g\frac{\partial\phi}{\partial P_g}-\frac{S_g\phi}{B_g}\frac{\partial B_g}{\partial P_g}\right)\frac{\partial P_g}{\partial t}+\frac{R_{so}B_g\phi}{B_o}\frac{\partial S_o}{\partial t}$$

$$+\frac{R_{so}B_gS_o}{B_o}\frac{\partial\phi}{\partial P_g}+\frac{B_gS_o\phi}{B_o}\frac{\partial R_{so}}{\partial P_g}-\frac{R_{so}B_gS_o\phi}{B_o^2}\frac{\partial B_o}{\partial P_g}\Big)\frac{\partial P_g}{\partial t}$$

$$+\frac{R_{sw}B_g\phi}{B_w}\frac{\partial S_w}{\partial t}+\left(\frac{R_{sw}B_gS_w}{B_w}\frac{\partial\phi}{\partial P_g}+\frac{B_gS_w\phi}{B_w}\frac{\partial R_{sw}}{\partial P_g}\right.$$

$$\left.-\frac{R_{sw}B_gS_w\phi}{B_w^2}\frac{\partial B_w}{\partial P_g}\right)\frac{\partial P_g}{\partial t}\qquad\ldots\qquad(1\_53)$$

Assuming that

$$\Delta_t P_o=\Delta_t P_w=\Delta_t P_g=\Delta_t P$$

Adding Eqs.(1.51), (1.52) and (1.53), we get

$$(B_o - R_{so}B_g)\left\{\nabla.\overleftrightarrow{K}\left(\frac{\lambda_o}{B_o}\right)\nabla P + CG_o - \frac{q_o}{\rho_{osc}}\right\} +$$

$$(B_w - R_{sw}B_g)\left\{\nabla.\overleftrightarrow{K}\left(\frac{\lambda_w}{B_w}\right)\nabla P + CG_w - \frac{q_w}{\rho_{wsc}}\right\} +$$

$$B_g\left\{\nabla.\overleftrightarrow{K}\left(\frac{\lambda_g}{B_g} + \frac{R_{so}\lambda_o}{B_o} + \frac{R_{sw}\lambda_w}{B_w}\right)\nabla P + CG_g\right.$$

$$\left. - \frac{q_g}{\rho_{gsc}}\right\} = \left[\phi\left(\frac{\partial S_o}{\partial t} + \frac{\partial S_w}{\partial t} + \frac{\partial S_g}{\partial t}\right) + \left\{(S_o + S_w + S_g)\frac{\partial \phi}{\partial P}\right.\right.$$

$$- \frac{S_o\phi}{B_o}\frac{\partial B_o}{\partial P} - \frac{S_g\phi}{B_g}\frac{\partial B_g}{\partial P} + \frac{B_gS_o\phi}{B_o}\frac{\partial R_{so}}{\partial P} +$$

$$\left.\left.\frac{B_gS_w\phi}{B_w}\frac{\partial R_{sw}}{\partial P}\right\}\right]\frac{\partial P}{\partial t} \qquad \ldots \qquad (1\text{-}54)$$

Since

$$S_o + S_w + S_g = 1 \quad ,$$

$$\frac{\partial S_o}{\partial t} + \frac{\partial S_w}{\partial t} + \frac{\partial S_g}{\partial t} = 0 \qquad \ldots \qquad (1\text{-}55)$$

Now the RHS of Eq.(1.54) becomes:

$$\left\{ \frac{\partial \phi}{\partial P} + S_o \phi \left(-\frac{1}{B_o} \frac{\partial B_o}{\partial P} + \frac{B_g}{B_o} \frac{\partial R_{so}}{\partial P} \right) + \right.$$

$$S_w \phi \left(-\frac{1}{B_w} \frac{\partial B_w}{\partial P} + \frac{B_g}{B_w} \frac{\partial R_{sw}}{\partial P} \right) +$$

$$\left. S_g \phi \left(-\frac{1}{B_g} \frac{\partial B_g}{\partial P} \right) \right\} \frac{\partial P}{\partial t} \quad . \quad . \quad . \quad . \quad (1\_56)$$

As the oil, water, gas and rock compressibilities are identified as,

$$c_o = -\frac{1}{B_o} \frac{\partial B_o}{\partial P_o} + \frac{B_g}{B_o} \frac{\partial R_{so}}{\partial P_o} \quad . \quad . \quad . \quad . \quad (1\_57)$$

$$c_w = -\frac{1}{B_w} \frac{\partial B_w}{\partial P_w} + \frac{B_g}{B_w} \frac{\partial R_{sw}}{\partial P_w} \quad . \quad . \quad . \quad . \quad (1\_58)$$

$$c_g = -\frac{1}{B_g} \frac{\partial B_g}{\partial P_g} \quad . \quad . \quad . \quad . \quad . \quad (1\_59)$$

$$c_r = \frac{1}{\phi} \frac{\partial \phi}{\partial P} \quad . \quad . \quad . \quad . \quad . \quad (1\_60)$$

Substituting c_o, c_w and c_g in Eq.(1.56), it becomes

$$\phi\left(c_r + c_o S_o + c_w S_w + c_g S_g\right)\frac{\partial P}{\partial t} \quad . \quad . \quad . \quad (1\_G1)$$

Now defining the total compressibility as

$$c_t = c_r + c_o S_o + c_w S_w + c_g S_g$$

we would get the "pressure equation", in which no explicit time derivatives of saturations are present.

1.6 Pressure Equation

$$(B_o - R_{so}B_g)\left\{\nabla\cdot\overleftrightarrow{K}\left(\frac{\lambda_o}{B_o}\right)\nabla P + CG_o - \frac{q_o}{\rho_{osc}}\right\} +$$

$$(B_w - R_{sw}B_g)\left\{\nabla\cdot\overleftrightarrow{K}\left(\frac{\lambda_w}{B_w}\right)\nabla P + CG_w - \frac{q_w}{\rho_{wsc}}\right\} +$$

$$B_g\left\{\nabla\cdot\overleftrightarrow{K}\left(\frac{\lambda_g}{B_g} + \frac{R_{so}\lambda_o}{B_o} + \frac{R_{sw}\lambda_w}{B_w}\right)\nabla P + CG_g - \frac{q_g}{\rho_{gsc}}\right\} = \phi c_t \frac{\partial P}{\partial t}$$

. . . (1_G2)

First numerically solving Eq.(1.62) for P^{n+1}, and then we would get S_o^{n+1}, S_w^{n+1} using the calculated P in Eqs.(1.48) and (1.49). S_g is again determined from the equality $S_o + S_w + S_g - 1$.

Once Eq.(1.63) is solved for P, then S_w^{n+1} can be explicitly determined from Eq.(1.69)

$$\nabla . \overleftrightarrow{K} \left(\frac{\lambda_w}{B_w}\right) \nabla P + CG_w - \frac{q_w}{\rho_{wsc}}$$

$$= \frac{\partial}{\partial t}\left(\frac{\phi S_w}{B_w}\right) \quad . \quad . \quad . \quad . \quad . \quad . \quad (1\_64)$$

Using S_w^{n+1}, P_{cgw} is updated for new time level.

Aquifer Model

This model considers only the flow of a single phase, water. Since no oil and gas are present in the system, the oil and gas phase terms are deleted from the pressure Eq.(1.62) and we obtain the pressure equation for the aquifer model as follows:

$$B_w \left\{ \nabla . \overleftrightarrow{K} \left(\frac{\lambda_w}{B_w}\right) \nabla P + CG_w - \frac{q_w}{\rho_{wsc}} \right\}$$

$$= \phi c_t \frac{\partial P}{\partial t} \quad . \quad . \quad . \quad . \quad . \quad (1\_65)$$

Since only single phase is flowing in the system, relative permeability becomes unity. In Eq.(1.70), CG_w is defined as

$$CG_w = -\dot{\nabla}.\left(\frac{\overleftrightarrow{K}}{\mu_w B_w}\right)\rho_w \nabla z \quad . \quad . \quad . \quad . \quad (1\_66)$$

$$\lambda_w = \frac{k_{rw}}{\mu_w} = \frac{1}{\mu_w} \quad . \quad . \quad . \quad . \quad . \quad (1\_67)$$

$$c_t = c_r + c_w \quad . \quad . \quad . \quad . \quad . \quad (1\_68)$$

CHAPTER 2: FINITE DIFFERENCE APPROXIMATIONS

Introduction

By the application of the conservation of mass principle, we have now translated the three-dimensional, three-phase black oil model into a system of coupled, non-linear partial differential equations. Although many methods exist for obtaining analytical solutions of PDEs, they are primarily limited to linear equations with regular boundary conditions. For most practical situations, however, it is generally impossible to obtain exact or analytical solutions to the PDEs describing reservoirs because of their nonlinearities. Instead, finite difference approximation methods are used almost exclusively to treat such problems.

2.1 Finite Difference Method

Finite difference methods transform the nonlinear PDEs into sets of nonlinear algebraic equations which are solved for discrete points in the computational region. These algebraic equations are known as

the finite difference equations, and are derived by replacing the derivatives in the PDEs with algebraic approximations. To determine the discrete representation of derivatives, it is useful to review what a derivative means. Derivatives represent rates of change. A derivative contains information about the local variation of a function. Therefore, a difference approximation to a derviative can be achieved by using the Taylor series expansion of the function about a neighbouring point. Thus, expanding a function of four independent variables, say, P (x, y, z, t):

$$P(x+\Delta x, y, z, t) = P(x, y, z, t) + \Delta x \left(\frac{\partial P}{\partial x}\right)_{x,y,z,t} + \frac{(\Delta x)^2}{2!}\left(\frac{\partial^2 P}{\partial x^2}\right)_{x,y,z,t} + \frac{(\Delta x)^3}{3!}\left(\frac{\partial^3 P}{\partial x^3}\right)_{x^*,y,z,t} \quad . \quad . \quad . \quad (2\text{-}1)$$

where. $x \leqslant x^* \leqslant x + \Delta x$

Solving for $\frac{\partial P}{\partial x}$,

$$\left(\frac{\partial P}{\partial x}\right)_{x,y,z,t} = \frac{P(x+\Delta x, y, z, t) - P(x, y, z, t)}{\Delta x} - \frac{\Delta x}{2}\left(\frac{\partial^2 P}{\partial x^2}\right)_{x^*,y,z,t} \quad . \quad . \quad . \quad (2\text{-}2)$$

$$\left(\frac{\partial P}{\partial x}\right)_{x,y,z,t} = \frac{P^{t}_{i+1,j,k} - P^{t}_{ijk}}{\Delta x} + O(\Delta x) \quad . \quad . \quad (2\text{-}3)$$

where O(Δx) denotes terms containing first and higher powers of Δx, which is known as the truncation error. If this error is neglected from Eq.(2.3) what we would get now is called the finite difference approximation to the first-order derivative at the grid point (x, y, z or iΔx, jΔy, kΔz or in short i, j, k) at time level t. That is,

$$\left(\frac{\partial P}{\partial x}\right)^{t}_{ijk} \simeq \frac{P^{t}_{i+1,j,k} - P^{t}_{ijk}}{\Delta x} \quad . \quad . \quad . \quad . \quad (2\text{-}4)$$

Eq.(2.4) is referred to as a '<u>forward difference approximation</u>'.

Similarly we can expand P(x − Δx, y, z, t) about the point (x, y, z, t)as:

$$P(x-\Delta x,y,z,t) = P(x,y,z,t) - \Delta x\left(\frac{\partial P}{\partial x}\right)_{x,y,z,t} + \frac{(\Delta x)^2}{2!}\left(\frac{\partial^2 P}{\partial x^2}\right)_{x,y,z,t} - \frac{(\Delta x)^3}{3!}\left(\frac{\partial^3 P}{\partial x^3}\right)_{x^{**},y,z,t} \quad . \quad . \quad (2\text{-}5)$$

where

$$x - \Delta x \leqslant x^{**} \leqslant x$$

Solving for $\frac{\partial P}{\partial x}$, we obtain a '<u>backward difference approximation</u>'.

$$\left(\frac{\partial P}{\partial x}\right)^{t}_{ijk} \simeq \frac{P^{t}_{ijk} - P^{t}_{i-1,j,k}}{\Delta x} \qquad . \qquad . \qquad . \qquad (2\text{-}6)$$

In both the forward and backward difference approximation, the error is of the same order, that is , $O(\Delta x)$. On the other hand, the centered difference is of high order, since the error term is $O(\Delta x)^2$.

The '<u>centered difference approximation</u>' is derived from substracting Eq.(2.5) from Eq.(2.1) and rearranging it gives:

$$\left(\frac{\partial P}{\partial x}\right)^{t}_{ijk} \simeq \frac{P^{t}_{i+1,j,k} - P^{t}_{i-1,j,k}}{2(\Delta x)} \qquad . \qquad . \qquad . \qquad . \qquad (2\text{-}7)$$

In a similar manner we can obtain an approximation for the second derivative by adding Eqs.(2.1) and (2.5) and rearranging it gives:

$$\left(\frac{\partial^2 P}{\partial x^2}\right)^t_{ijk} \simeq \frac{P^t_{i-1,j,k} - 2P^t_{ijk} + P^t_{i+1,j,k}}{(\Delta x)^2} \quad \cdots \quad (2-8)$$

which is of second-order accuracy.

We have noted in the pressure equation and the phase-saturation equations the very frequent occurence of the second derivative of the form:

$$\nabla . \overleftrightarrow{K} \left(\frac{\lambda_p}{B_p}\right) \nabla P_p ,$$

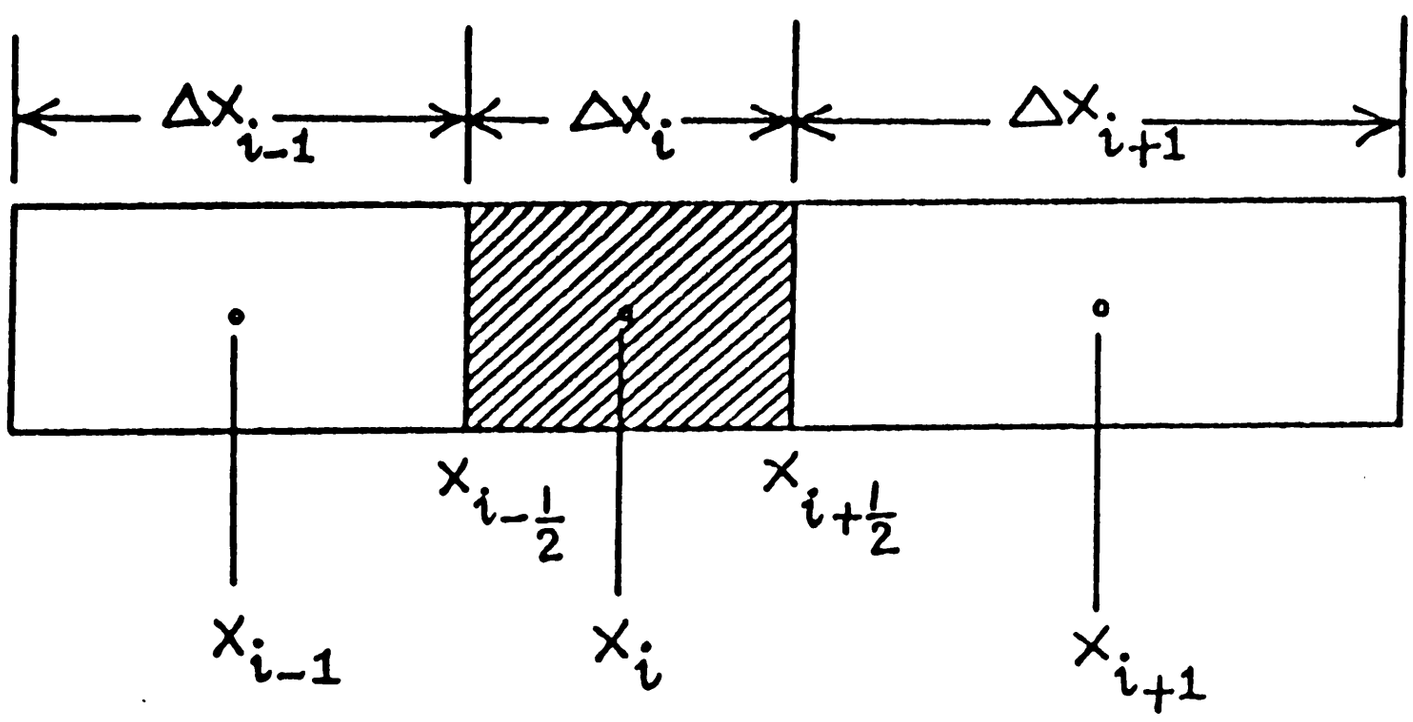
$$\frac{\partial}{\partial x}\left[K_x\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P_p}{\partial x}\right] + \frac{\partial}{\partial y}\left[K_y\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P_p}{\partial y}\right]$$

$$+ \frac{\partial}{\partial z}\left[K_z\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P_p}{\partial z}\right] \quad \cdots \quad (2-9)$$

The terms in Eq.(2.9) are readily seen to be nonlinear because $K\left(\frac{\lambda_p}{B_p}\right)$ is function of pressure and position. Although analytical methods of solution for linear equations normally fail to cope with nonlinear differential equations, the finite difference method can be applied without modification to both linear and nonlinear problems. Now, we would try to approximate the function derivative, say, $\frac{\partial}{\partial x}\left[K_x\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P}{\partial x}\right]$ because it is the only approximation we need for our purpose. Using the block-centered grid system (Fig.2.1).

Let $\psi = K_x\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P}{\partial x}$, then using a central difference approximation, we can write as:

$$\frac{\partial \psi}{\partial x} = \frac{\psi_{i+\frac{1}{2}} - \psi_{i-\frac{1}{2}}}{x_{i+\frac{1}{2}} - x_{i-\frac{1}{2}}} = \frac{\psi_{i+\frac{1}{2}} - \psi_{i-\frac{1}{2}}}{\Delta x_i} \qquad (2-10)$$



(Fig.2.1).

$\psi_{i+\frac{1}{2}}$ and $\psi_{i-\frac{1}{2}}$ are determined as

$$\psi_{i+\frac{1}{2}} = \left(K_x \frac{\lambda_p}{B_p}\right)_{i+\frac{1}{2}} \frac{P_{i+1} - P_i}{x_{i+1} - x_i} \quad . \quad . \quad . \qquad (2-11)$$

$$\psi_{i-\frac{1}{2}} = \left(K_x \frac{\lambda_p}{B_p}\right)_{i-\frac{1}{2}} \frac{P_i - P_{i-1}}{x_i - x_{i-1}} \quad . \quad . \quad . \qquad (2-12)$$

Substituting Eqs.(2.11) and (2.12) in Eq.(2.10), we obtain:

$$\frac{\partial}{\partial x}\left[K_x\left(\frac{\lambda_\rho}{B_\rho}\right)\frac{\partial P}{\partial x}\right] = \frac{1}{\Delta x_i}\left(K_x\frac{\lambda_\rho}{B_\rho}\right)_{i+\frac{1}{2}}\frac{P_{i+1}-P_i}{x_{i+1}-x_i} - \left(K_x\frac{\lambda_\rho}{B_\rho}\right)_{i-\frac{1}{2}}\frac{P_i-P_{i-1}}{x_i-x_{i-1}}\Bigg] \tag{2-13}$$

$$= \frac{1}{\Delta x_i}\Bigg[\left(\frac{\lambda_\rho}{B_\rho}\right)_{i+\frac{1}{2}} K_{x,i+\frac{1}{2}} \frac{\Delta y_i \Delta z_i}{\Delta y_i \Delta z_i} \cdot \frac{P_{i+1}-P_i}{\frac{\Delta x_i + \Delta x_{i+1}}{2}} -$$

$$\left(\frac{\lambda_\rho}{B_\rho}\right)_{i-\frac{1}{2}} K_{x,i-\frac{1}{2}} \frac{\Delta y_i \Delta z_i}{\Delta y_i \Delta z_i} \frac{P_i - P_{i-1}}{\frac{\Delta x_i + \Delta x_{i-1}}{2}}\Bigg]$$

$$= \frac{1}{\Delta x_i \Delta y_i \Delta z_i}\Bigg[\left(\frac{\lambda_\rho}{B_\rho}\right)_{i+\frac{1}{2}} K_{x,i+\frac{1}{2}} (\Delta y_i \Delta z_i) \frac{2}{\Delta x_i + \Delta x_{i+1}} (P_{i+1} - P_i)$$

$$- \left(\frac{\lambda_\rho}{B_\rho}\right)_{i-\frac{1}{2}} K_{x,i-\frac{1}{2}} (\Delta y_i \Delta z_i) \frac{2}{\Delta x_i + \Delta x_{i-1}} (P_i - P_{i-1})\Bigg] \tag{2-14}$$

Assuming that the cross-sectional area remains constant from block to block, Eq.(2.14) can be written as:

$$(\Delta x_i \Delta y_i \Delta z_i)\frac{\partial}{\partial x}\left[K_x\left(\frac{\lambda_\rho}{B_\rho}\right)\frac{\partial P}{\partial x}\right] = \left(\frac{\lambda_\rho}{B_\rho}\right)_{i+\frac{1}{2}} (K_x A)_{i+\frac{1}{2}} \frac{2(P_{i+1}-P_i)}{\Delta x_i + \Delta x_{i+1}}$$

$$- \left(\frac{\lambda_\rho}{B_\rho}\right)_{i-\frac{1}{2}} (K_x A)_{i-\frac{1}{2}} \frac{2(P_i - P_{i-1})}{\Delta x_i + \Delta x_{i-1}} \tag{2-15}$$

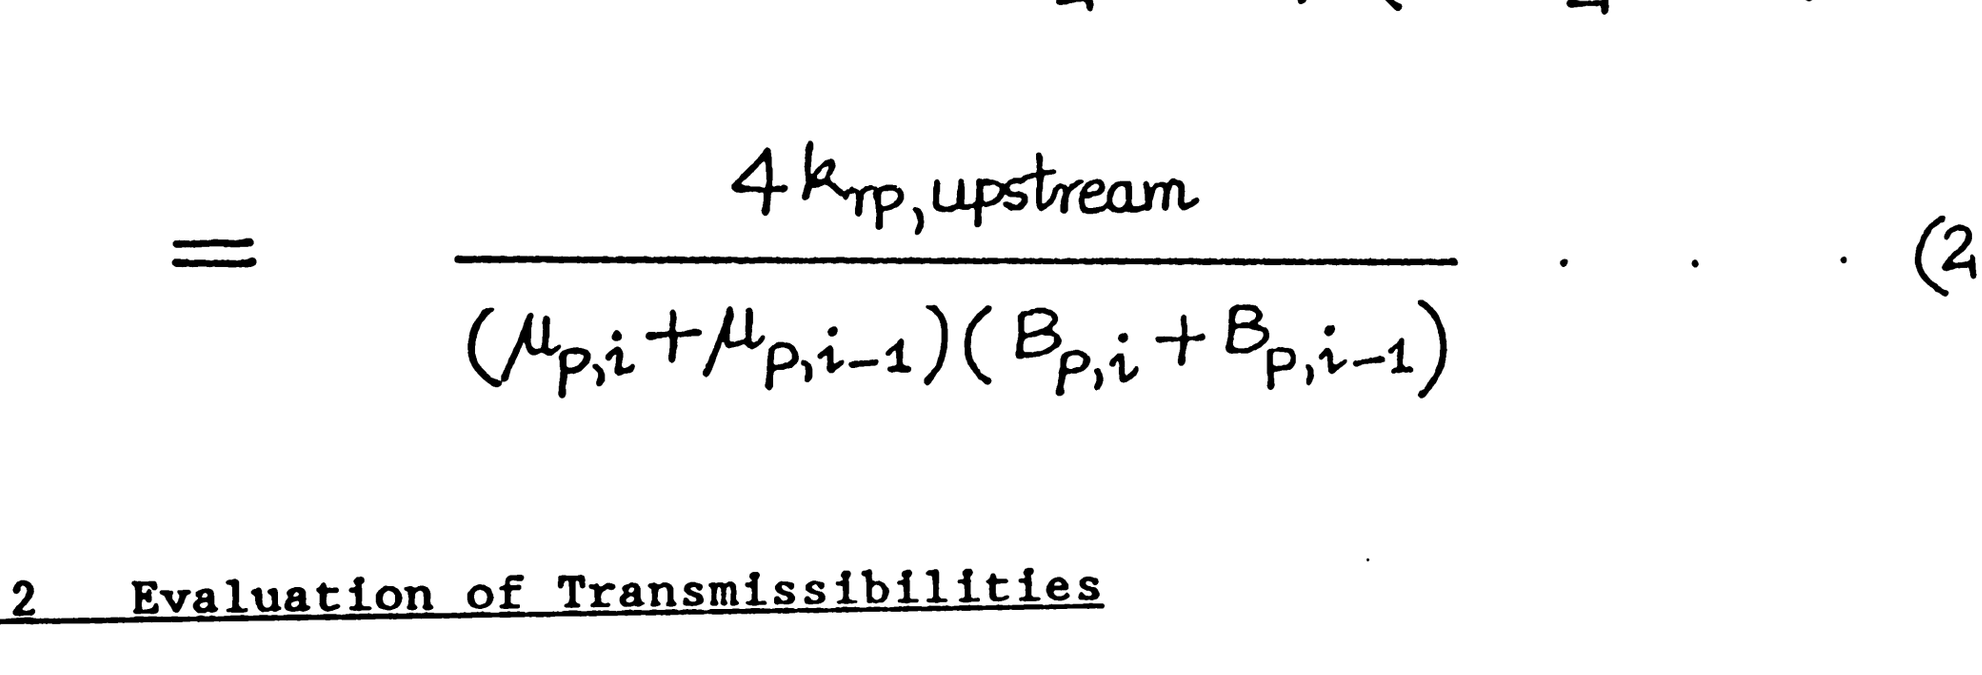
We still have the task to determine a suitable average for each of $\left(\frac{\lambda_p}{B_p}\right)$ and $\overline{KA}$. Industry experience (Crichlow(1977)for example) has shown that use of a phase mobility in the block which has the larger phase potential of the two neighbouring blocks yields more reliable results. Thus, we use the value of the phase saturation of the upsteam block at time level 'n' to determine an upstream phase relative permeability. This is then combined with the arithmetic mean values of the phase viscosities and phase formation volume factors.

$$\left(\frac{\lambda_p}{B_p}\right)_{i-\frac{1}{2}} = \left(\frac{k_{rp}}{\mu_p B_p}\right)_{i-\frac{1}{2}} = \frac{k_{rp,\,upstream}}{\left(\frac{\mu_{p,i}+\mu_{p,i-1}}{2}\right)\left(\frac{B_{p,i}+B_{p,i-1}}{2}\right)}$$

$$= \frac{4\,k_{rp,\,upstream}}{(\mu_{p,i}+\mu_{p,i-1})(B_{p,i}+B_{p,i-1})} \quad \ldots \quad (2\text{-}16)$$

2.2 Evaluation of Transmissibilities

Hence, we will derive a useful formula for a mean harmonic value of KA product. Supposing the transmissibility is piecewise constant with interface between (i) and (i-1) blocks (Fig.2.2).



(Fig.2.2).

Then the flow rate between block (i) and block (i-1) is

$$\overline{Q}_p = \left(\frac{\lambda_p}{B_p}\right)_{avg} \overline{KA} \; \frac{P_{i-1} - P_i}{\frac{\Delta x_{i-1} + \Delta x_i}{2}} \qquad (2\text{-}17)$$

where $\left(\frac{\lambda_p}{B_p}\right)_{avg}$ is calculated from Eq.(2.16). $\overline{KA}$ is an equivalent permeability-cross sectional area product for block (i-1) and block (i).

Applying Darcy's law to each shaded volume element with homogeneous physical properties:

$$\overline{Q}_p = \left(\frac{\lambda_p}{B_p}\right)_{avg} (K_x A)_{i-1} \frac{P_{i-1} - P_f}{\frac{\Delta x_{i-1}}{2}} \qquad (2\text{-}18)$$

and

$$\overline{Q}_p = \left(\frac{\lambda_p}{B_p}\right)_{avg} (K_x A)_i \frac{P_f - P_i}{\frac{\Delta x_i}{2}} \qquad (2\text{-}19)$$

where

P_f - the pressure at the interface.

Elimination of P_f from Eqs.(2.18) and (2.19) yields

$$P_{i-1} - P_i = \frac{1}{2}\bar{Q}_P\left(\frac{\beta_P}{\lambda_P}\right)_{avg}\left[\frac{\Delta x_{i-1}}{(K_xA)_{i-1}} + \frac{\Delta x_i}{(K_xA)_i}\right] \quad . \quad . \quad . \quad . \quad (2\text{-}20)$$

Substitution of Eq.(2.20) into Eq.(2.17) and solving it yields KA as

$$\overline{KA} = \frac{\Delta x_i + \Delta x_{i-1}}{\frac{\Delta x_i}{(K_xA)_i} + \frac{\Delta x_{i-1}}{(K_xA)_{i-1}}} \quad . \quad . \quad . \quad (2\text{-}21)$$

which is equivalent to $(K_xA)_{i-\frac{1}{2}}$

Similarly $(K_xA)_{i+\frac{1}{2}}$ can be determined using Eq.(2.21).

$$(K_xA)_{i+\frac{1}{2}} = \frac{\Delta x_i + \Delta x_{i+1}}{\frac{\Delta x_i}{(K_xA)_i} + \frac{\Delta x_{i+1}}{(K_xA)_{i+1}}} \quad \ldots \quad (2\text{-}22)$$

Substituting Eqs.(2.16), (2.21) and (2.22) for $\left(\frac{\lambda_p}{B_p}\right)$ and KA in Eq.(2.15), we obtain

$$(\Delta x_i \Delta y_i \Delta z_i)\frac{\partial}{\partial x}\left[K_x\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P}{\partial x}\right] = \frac{4\,k_{rp,upstream}}{(\mu_{p,i}+\mu_{p,i+1})(B_{p,i}+B_{p,i+1})}$$

$$\frac{2(K_xA)_i(K_xA)_{i+1}(P_{i+1}-P_i)}{\Delta x_i(K_xA)_{i+1}+\Delta x_{i+1}(K_xA)_i} - \frac{4\,k_{rp,upstream}}{(\mu_{p,i}+\mu_{p,i-1})(B_{p,i}+B_{p,i-1})}$$

$$\frac{2(K_xA)_i(K_xA)_{i-1}(P_i-P_{i-1})}{\Delta x_i(K_xA)_{i-1}+\Delta x_{i-1}(K_xA)_i} \quad \ldots \quad (2\text{-}23)$$

$$\Delta x_i \Delta y_i \Delta z_i = V_B \quad \ldots \quad (2\text{-}24)$$

$$A_{p,i+\frac{1}{2}} = \frac{4\,k_{rp,upstream}}{(\mu_{p,i}+\mu_{p,i+1})(B_{p,i}+B_{p,i+1})} \cdot$$

$$\frac{2(K_xA)_i\,(K_xA)_{i+1}}{\Delta x_i(K_xA)_{i+1}+\Delta x_{i+1}(K_xA)_i} \quad . \quad . \quad . \quad (2\text{-}25)$$

$$A_{p,i-\frac{1}{2}} = \frac{4\,k_{rp,upstream}}{(\mu_{p,i}+\mu_{p,i-1})(B_{p,i}+B_{p,i+1})} \cdot$$

$$\cdot \frac{2(K_xA)_i\,(K_xA)_{i-1}}{\Delta x_i(K_xA)_{i-1}+\Delta x_{i-1}(K_xA)_i} \quad . \quad . \quad . \quad (2\text{-}26)$$

$A_{p,i+\frac{1}{2}}$ and $A_{p,i-\frac{1}{2}}$ are called the '<u>finite difference transmissibilities</u>' between (i) and (i + 1), and between (i) and (i − 1) blocks. Substituting Eqs.(2.24), (2.25) and (2.26) into Eq:(2.23), we obtain

$$V_B \frac{\partial}{\partial x}\left[K_x\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P}{\partial x}\right] = A_{p,i+\frac{1}{2}}(P_{i+1}-P_i) +$$

$$A_{p,i-\frac{1}{2}}(P_{i-1}-P_i)$$

$$. \quad . \quad . \quad . \quad . \quad . \quad (2\text{-}27)$$

Using a linear difference operator to express Eq.(2.27) in a compact form,

$$V_B \cdot \frac{\partial}{\partial x}\left[K_x\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P}{\partial x}\right] = \Delta_x A_x \Delta_x P$$

$$= A_{p,i+\frac{1}{2}}(P_{i+1} - P_i) + A_{p,i-\frac{1}{2}}(P_{i-1} - P_i) \quad . \quad . \quad . \quad . \quad . \quad (2\text{-}28)$$

Similarly, we can write for

$$V_B \cdot \frac{\partial}{\partial y}\left[K_y\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P}{\partial y}\right] \quad \text{and} \quad V_B \cdot \frac{\partial}{\partial z}\left[K_z\left(\frac{\lambda_p}{B_p}\right)\frac{\partial P}{\partial z}\right]$$

using Eq.(2.9),

$$V_B \cdot \left[\nabla \cdot \overleftrightarrow{K}\left(\frac{\lambda_p}{B_p}\right)\nabla P\right] = \Delta_x A_x \Delta_x P + \Delta_y A_y \Delta_y P +$$

$$\Delta_z A_z \Delta_z P = \Delta A \Delta P \quad . \quad . \quad . \quad . \quad (2\text{-}29)$$

2.3 The IMPES Procedure to Solve the Pressure Equation

Using the above notation, we can write the pressure equation of Eq.(1.62) as:

$$\left(B_o^n - B_g^n R_{so}^n\right)_{ijk}\left(\Delta A_o^n \Delta P^{n+1} + GOWT - \frac{q_o V_B}{\rho_{osc}}\right)_{ijk}$$

$$+\left(B_w^n - B_g^n R_{sw}^n\right)_{ijk}\left(\Delta A_w^n \Delta P^{n+1} + GWWT - \frac{q_w V_B}{\rho_{wsc}}\right)_{ijk}$$

$$+\left(B_g^n\right)_{ijk}\left(\Delta A_g^n \Delta P^{n+1} + \Delta R_{so}^n A_o^n \Delta P^{n+1} + \Delta R_{sw}^n A_w^n \Delta P^{n+1}\right.$$

$$\left. + G\dot{G}WT - \frac{q_g V_B}{\rho_{gsc}}\right)_{ijk} = = \left(\frac{V_p^n c_t^n}{\Delta t}\right)_{ijk}\left(P_{ijk}^{n+1} - P_{ijk}^n\right)$$

. . . . . (2-30)

where

$$V_p^n = (\Delta x_i \Delta y_i \Delta z_i)\, \phi_{ijk}^n \qquad (2\text{-}31)$$

$$GOWT = V_B \cdot \left[-\nabla \cdot \overleftrightarrow{K} \left(\frac{\lambda_o}{B_o} \right) \nabla (\rho_o z) \right]$$

$$= -\Delta \overset{n}{A}_o \Delta (\rho_o z)^n \qquad (2\text{-}32)$$

$$GWWT = V_B \cdot \left[-\nabla \cdot \overleftrightarrow{K} \left(\frac{\lambda_w}{B_w} \right) \nabla (\rho_w z + P_{cow}) \right]$$

$$= -\Delta \overset{n}{A}_w \Delta (\rho_w z + P_{cow})^n \qquad (2\text{-}33)$$

$$GGWT = V_B \cdot \left[\nabla \cdot \overleftrightarrow{K} \left\{ \frac{\lambda_g}{B_g} \nabla (P_{cgo} - \rho_g z) - \frac{R_{so} \lambda_o}{B_o} \nabla (\rho_o z) \right.\right.$$

$$\left.\left. - \frac{R_{sw} \lambda_w}{B_w} \nabla (P_{cow} + \rho_w z) \right\} \right]$$

$$= \Delta \left[\overset{n}{A}_g \Delta (P_{cgo} - \rho_g z)^n - \overset{n}{R}_{so} \overset{n}{A}_o \Delta (\rho_o z)^n - \right.$$

$$\left. \overset{n}{R}_{sw} \overset{n}{A}_w \Delta (P_{cow} + \rho_w z) \right] \qquad (2\text{-}34)$$

Let

$$QOWG = \left(B_o^n - B_g^n R_{so}^n\right)_{ijk}\left(\frac{q_o V_B}{\varrho_{osc}} - GOWT\right)_{ijk}$$

$$+\left(B_w^n - B_g^n R_{sw}^n\right)_{ijk}\left(\frac{q_w V_B}{\varrho_{wsc}} - GWWT\right)_{ijk} +$$

$$\left(B_g^n\right)_{ijk}\left(\frac{q_g V_B}{\varrho_{gsc}} - GGWT\right)_{ijk} \quad . \quad . \quad . \quad . \quad (2\text{-}35)$$

Substituting Eq.(2.35) in Eq.(2.30), we obtain

$$\left(B_o^n - B_g^n R_{so}^n\right)_{ijk}\left(\Delta A_o^n \Delta P^{n+1}\right)_{ijk} + \left(B_w^n - B_g^n R_{sw}^n\right)_{ijk}$$

$$\left(\Delta A_w^n \Delta P^{n+1}\right)_{ijk} + \left(B_g^n\right)_{ijk}\left(\Delta A_g^n \Delta P^{n+1} + \Delta R_{so}^n A_o^n \Delta P^{n+1}\right.$$

$$\left. + \Delta R_{sw}^n A_w^n \Delta P^{n+1}\right)_{ijk} = QOWG + \left(\frac{V_p^n c_t^n}{\Delta t}\right)_{ijk}\left(P_{ijk}^{n+1} - P_{ijk}^n\right)$$

$$. \quad . \quad . \quad . \quad . \quad (2\text{-}36)$$

Let

$$B = QOWG - \left(\frac{V_p^n c_t^n}{\Delta t}\right)_{ijk} P_{ijk}^n \quad . \quad . \quad . \quad (2\text{-}37)$$

Substituting Eq.(2.37) in Eq.(2.36) and rearranging it gives

$$\left(B_o^n - B_g^n R_{so}^n\right)_{ijk}\left(\Delta A_o^n \Delta P^{n+1}\right)_{ijk} + \left(B_w^n - B_g^n R_{sw}^n\right)_{ijk}$$

$$\left(\Delta A_w^n \Delta P^{n+1}\right)_{ijk} + \left(B_g^n\right)_{ijk}\left(\Delta A_g^n \Delta P^{n+1} + \Delta R_{so}^n A_o^n \Delta P^{n+1}\right.$$

$$\left. + \Delta R_{sw}^n A_w^n \Delta P^{n+1}\right)_{ijk} - \left(\frac{V_p^n c_t^n}{\Delta t}\right)_{ijk} P_{ijk}^{n+1} = B$$

$$. \quad . \quad . \quad (2\text{-}38)$$

Now, we would expand the left-hand side terms of Eq.(2.38). To simplify the expansion, let us consider for x-direction expansion only.

$$\left(B_o - B_g R_{so}\right)_{ijk} \Delta_x A_{ox} \Delta_x P + \left(B_w - B_g R_{sw}\right)_{ijk} \Delta_x A_{wx} \Delta_x P$$

$$+ \left(B_g\right)_{ijk}\left(\Delta_x A_{gx} \Delta_x P + \Delta_x R_{so,x} A_{ox} \Delta_x P + \Delta_x R_{sw,x} A_{wx} \Delta_x P\right)$$

$$= \left(B_o - B_g R_{so}\right)_{ijk}\left[A_{o,i+\frac{1}{2}}\left(P_{i+1} - P_{ijk}\right) + A_{o,i-\frac{1}{2}}\left(P_{i-1} - P_{ijk}\right)\right]$$

$$+ \left(B_w - B_g R_{sw}\right)_{ijk}\left[A_{w,i+\frac{1}{2}}\left(P_{i+1} - P_{ijk}\right) + A_{w,i-\frac{1}{2}}\left(P_{i-1} - P_{ijk}\right)\right] +$$

$$(B_g)_{ijk}\left[A_{g,i+\frac{1}{2}}(P_{i+1}-P_{ijk})+A_{g,i-\frac{1}{2}}(P_{i-1}-P_{ijk})+\right.$$

$$R_{so,i+\frac{1}{2}}A_{o,i+\frac{1}{2}}(P_{i+1}-P_{ijk})+R_{so,i-\frac{1}{2}}A_{o,i-\frac{1}{2}}(P_{i-1}-P_i)$$

$$\left.+R_{sw,i+\frac{1}{2}}A_{w,i+\frac{1}{2}}(P_{i+1}-P_{ijk})+R_{sw,i-\frac{1}{2}}A_{w,i-\frac{1}{2}}(P_{i-1}-P_{ijk})\right] \quad (2\text{-}39)$$

Collecting the terms for P_{i+1} only from Eq.(2.39),

$$(B_o-B_gR_{so})_{ijk}A_{o,i+\frac{1}{2}}+(B_w-B_gR_{sw})_{ijk}A_{w,i+\frac{1}{2}}+$$

$$(B_g)_{ijk}A_{g,i+\frac{1}{2}}+(B_g)_{ijk}R_{so,i+\frac{1}{2}}A_{o,i+\frac{1}{2}}+(B_g)_{ijk}R_{sw,i+\frac{1}{2}}A_{w,i+\frac{1}{2}}$$

$$=\left[(B_o-B_gR_{so})_{ijk}+(B_g)_{ijk}R_{so,i+\frac{1}{2}}\right]A_{o,i+\frac{1}{2}}+$$

$$\left[(B_w-B_gR_{sw})_{ijk}+(B_g)_{ijk}R_{sw,i+\frac{1}{2}}\right]A_{w,i+\frac{1}{2}}+$$

$$(B_g)_{ijk}A_{g,i+\frac{1}{2}} =$$

$$\left[B_o-B_gR_{so,i}+B_g\left(\frac{R_{so,i+1}+R_{so,i}}{2}\right)\right]A_{o,i+\frac{1}{2}}+$$

$$\left[B_w-B_gR_{sw,i}+B_g\left(\frac{R_{sw,i+1}+R_{sw,i}}{2}\right)\right]A_{w,i+\frac{1}{2}}+$$

$$B_gA_{g,i+\frac{1}{2}} =$$

$$\left[B_o+\frac{B_g}{2}\left(R_{so,i+1}-R_{so,i}\right)\right]A_{o,i+\frac{1}{2}}+\left[B_w+\frac{B_g}{2}\left(R_{sw,i+1}\right.\right.$$

$$\left.\left.-R_{sw,i}\right)\right]A_{w,i+\frac{1}{2}}+B_gA_{g,i+\frac{1}{2}} \quad . \quad . \quad . \quad (2\text{-}40)$$

Referring to (Fig.2.3), we can imagine that the block (i + 1, j, k) lies to the east of block (i, j, k). Similarly the blocks (i, j + 1, k), (i − 1, j, k) and (i, j − 1, k) lie respectively to the north, west and south of the centre block (i, j, k). Blocks (i, j, k − 1) and (i, j, k + 1) lie top and bottom of the centre block (i, j, k) respectively. Thus, Eq.(2.40) can be expressed, in short, as AE_i.

$$AE_i = \left[B_o + \frac{B_g}{2}\left(R_{so,i+1} - R_{so,i}\right)\right] A_{o,i+\frac{1}{2}} +$$

$$\left[B_w + \frac{B_g}{2}\left(R_{sw,i+1} - R_{sw,i}\right)\right] A_{w,i+\frac{1}{2}} + B_g A_{g,i+\frac{1}{2}} \quad \cdots \quad (2\text{-}41)$$

Similarly we can write for AW_i, AN_j, AS_j, AT_k as follows:

$$AW_i = \left[B_o + \frac{B_g}{2}\left(R_{so,i-1} - R_{so,i}\right)\right] A_{o,i-\frac{1}{2}} +$$

$$\left[B_w + \frac{B_g}{2}\left(R_{sw,i-1} - R_{sw,i}\right)\right] A_{w,i-\frac{1}{2}} + B_g A_{g,i-\frac{1}{2}} \quad \cdots \quad (2\text{-}42)$$

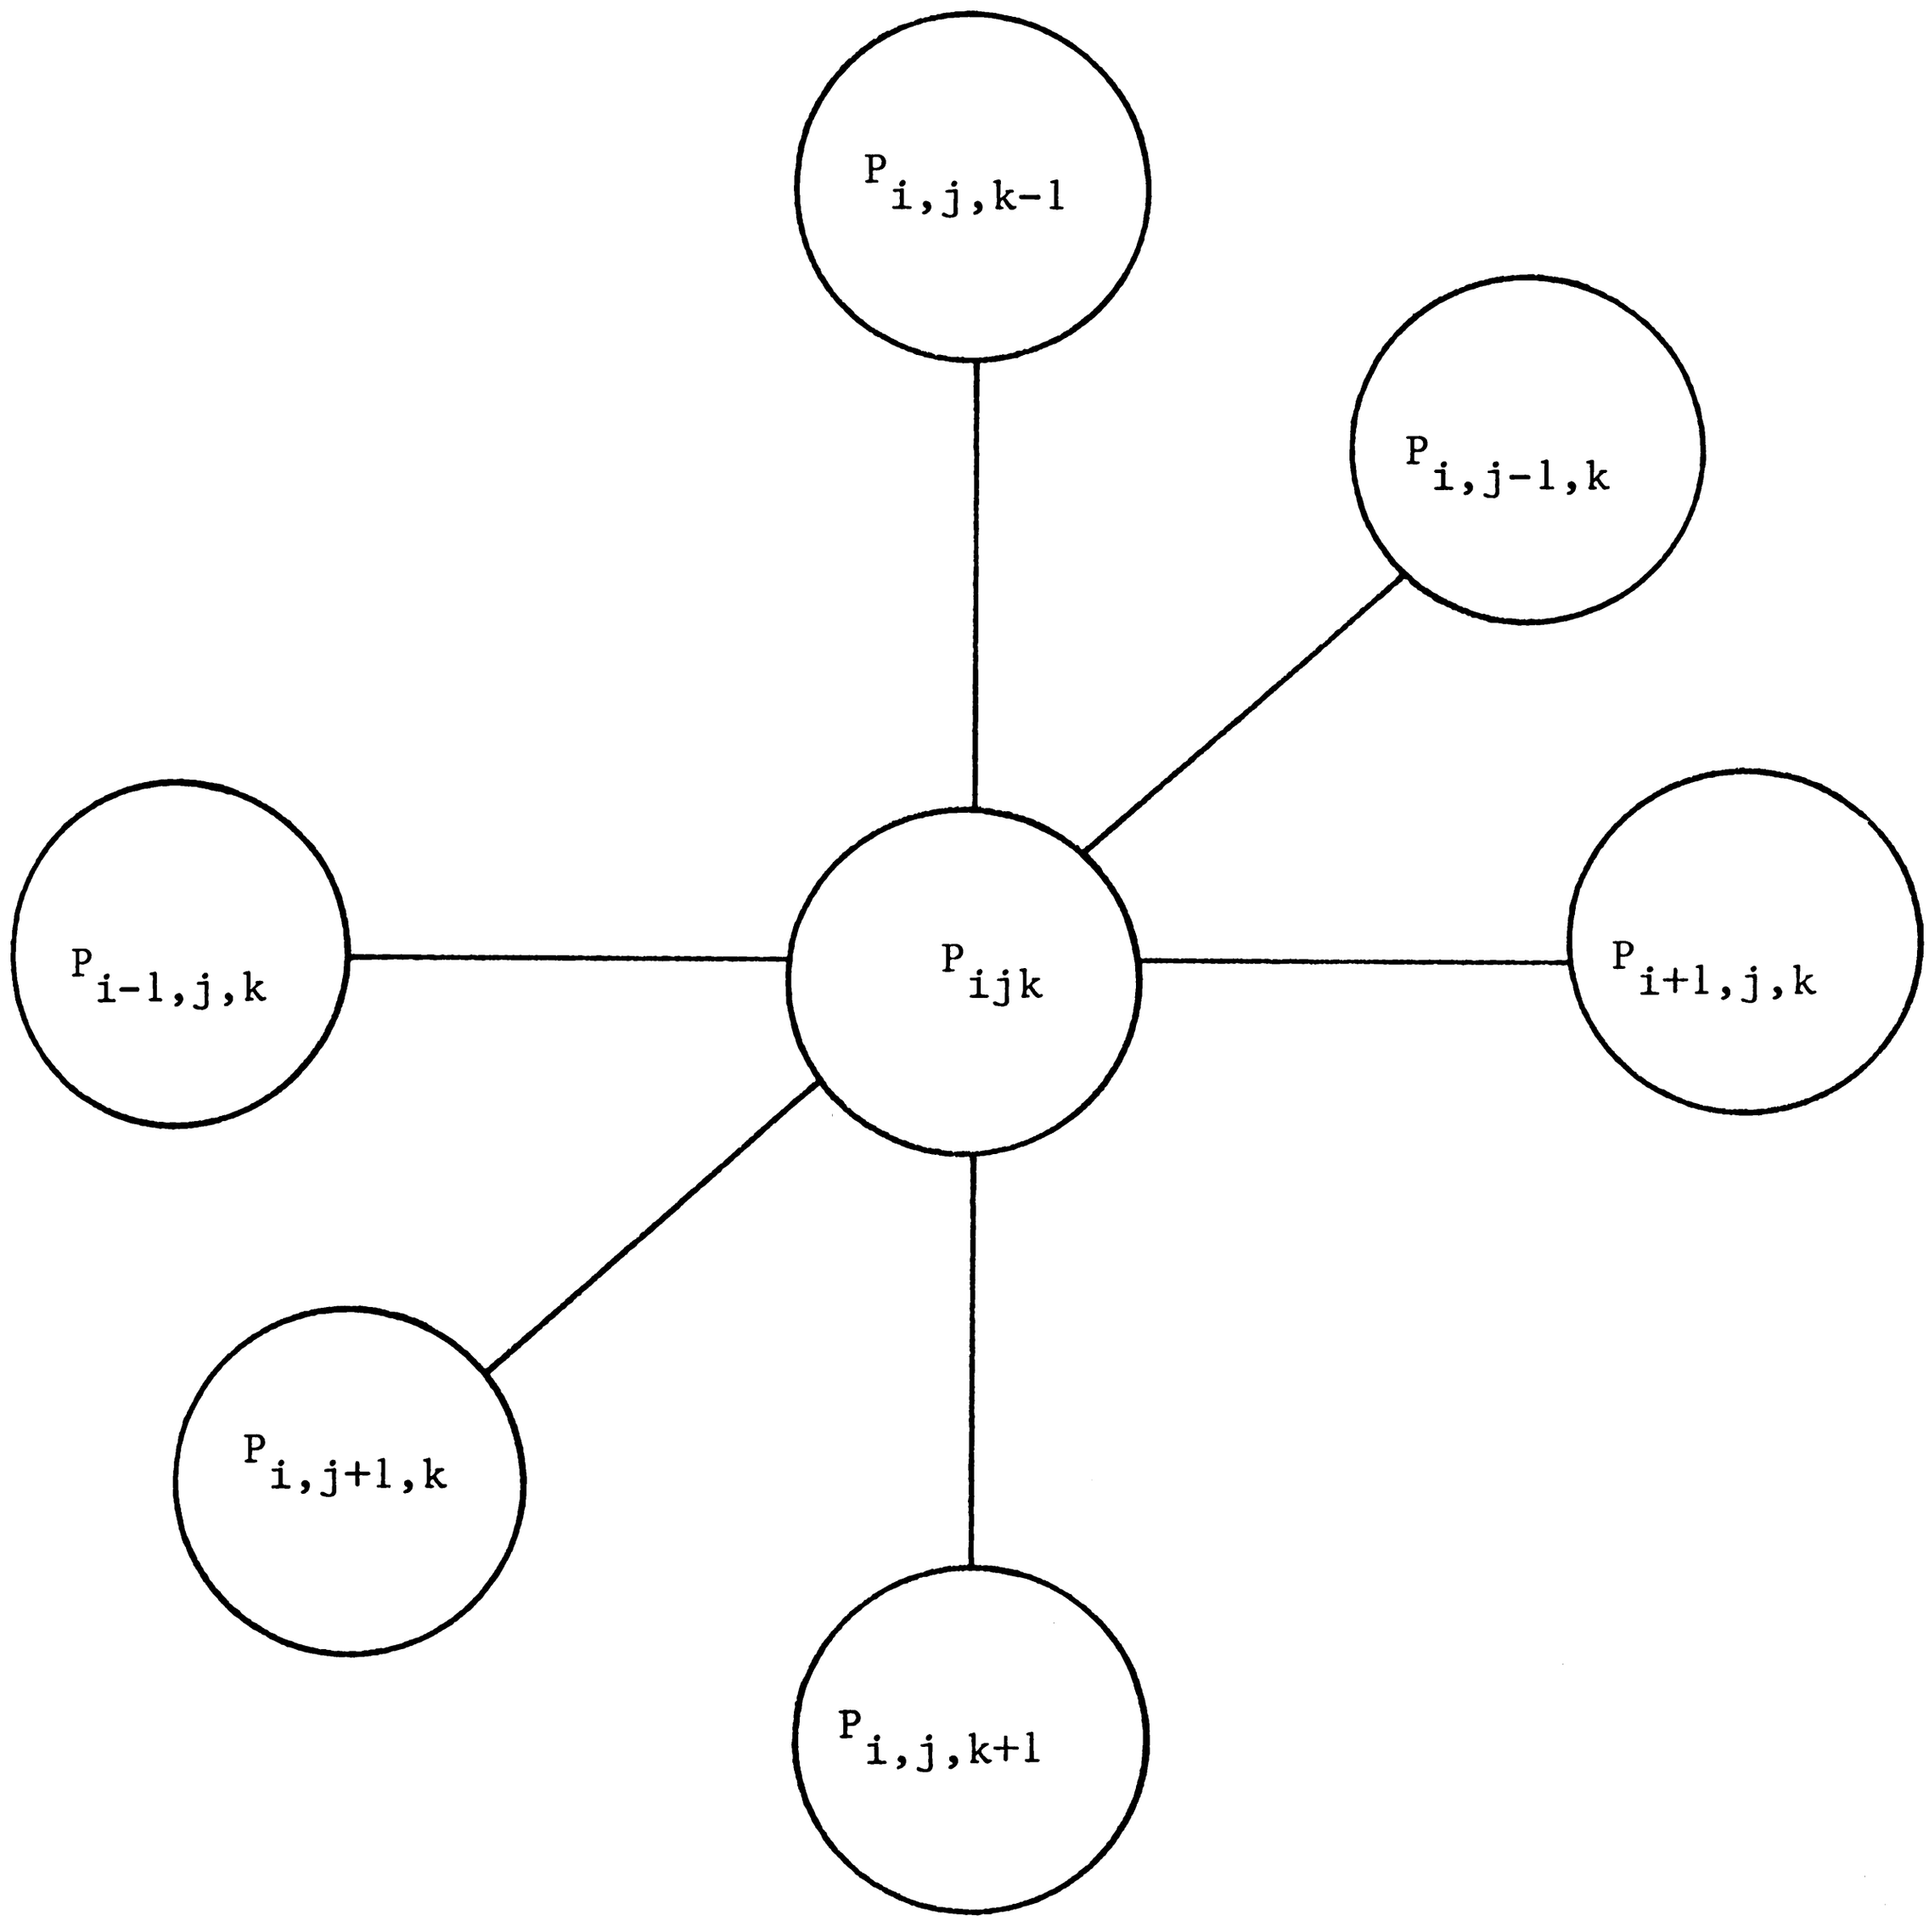


FIGURE (2.3)

$$AN_j = \left[B_o + \frac{B_g}{2}\left(R_{so,j+1} - R_{so,j}\right)\right] A_{o,j+\frac{1}{2}} +$$

$$\left[B_w + \frac{B_g}{2}\left(R_{sw,j+1} - R_{sw,j}\right)\right] A_{w,j+\frac{1}{2}} + B_g A_{g,j+\frac{1}{2}} \quad \cdot \quad (2\text{-}43)$$

$$AS_j = \left[B_o + \frac{B_g}{2}\left(R_{so,j-1} - R_{so,j}\right)\right] A_{o,j-\frac{1}{2}} +$$

$$\left[B_w + \frac{B_g}{2}\left(R_{sw,j-1} - R_{sw,j}\right)\right] A_{w,j-\frac{1}{2}} + B_g A_{g,j-\frac{1}{2}} \quad \cdot \quad (2\text{-}44)$$

$$AT_k = \left[B_o + \frac{B_g}{2}\left(R_{so,k-1} - R_{so,k}\right)\right] A_{o,k-\frac{1}{2}} +$$

$$\left[B_w + \frac{B_g}{2}\left(R_{sw,k-1} - R_{sw,k}\right)\right] A_{w,k-\frac{1}{2}} + B_g A_{g,k-\frac{1}{2}} \quad \cdot \quad (2\text{-}45)$$

$$AB_k = \left[B_o + \frac{B_g}{2}\left(R_{so,k+1} - R_{so,k}\right)\right] A_{o,k+\frac{1}{2}} +$$

$$\left[B_w + \frac{B_g}{2}\left(R_{sw,k+1} - R_{sw,k}\right)\right] A_{w,k+\frac{1}{2}} + B_g A_{g,k+\frac{1}{2}} \quad (2\text{-}46)$$

All of the quantities in Eqs.(2.41) to (2.46) are evaluated at the present (n) time level and many subscripts have been suppressed. Then, the pressure equation of Eq.(2.38) becomes:

$$AT_k P_{k-1}^{n+1} + AS_j P_{j-1}^{n+1} + AW_i P_{i-1}^{n+1} + AB_k P_{k+1}^{n+1} +$$

$$AN_j P_{j+1}^{n+1} + AE_i P_{i+1}^{n+1} - (AT_k + AS_j + AW_i + AB_k$$

$$+ AN_j + AE_i + \frac{V_p^n c_t^n}{\Delta t}) P_{ijk}^{n+1} = B \quad . \quad . \quad . \quad (2-47)$$

$$E = -(AT_k + AS_j + AW_i + AB_k + AN_j + AE_i$$

$$+ \frac{V_p^n c_t^n}{\Delta t}) \quad . \quad . \quad . \quad . \quad . \quad . \quad (2-48)$$

Finally, Eq.(2.47) becomes:

$$AT_k P_{k-1}^{n+1} + AS_j P_{j-1}^{n+1} + AW_i P_{i-1}^{n+1} + AB_k P_{k+1}^{n+1} +$$

$$AN_j P_{j+1}^{n+1} + AE_i P_{i+1}^{n+1} + E P_{ijk}^{n+1} = B \quad . \quad . \quad . \quad (2-49)$$

The total system of algebraic equations for the pressures at the new (n + 1) time level can be set for each block of the model grid using Eq.(2.49) because the coefficients of the (n + 1) time level pressures in Eq.(2.49) are all known. Different methods to solve these sets of simultaneous equations are presented in the next chapter. When the new pressures have been computed, they are used in oil and water phase saturation equations to find S_o^{n+1} and S_w^{n+1}.

2.4 Phase Saturation Equations

OIL

$$\left(\Delta A_o^n \Delta P^{n+1} + GOWT - \frac{q_o V_B}{\rho_{osc}} \right)_{ijk} =$$

$$\frac{1}{\Delta t}\left[\left(\frac{V_p S_o}{B_o}\right)^{n+1}_{ijk} - \left(\frac{V_p S_o}{B_o}\right)^{n}_{ijk}\right] \quad . \quad . \quad . \quad . \quad (2\text{-}50)$$

WATER

$$\left(\Delta A_w^n \Delta P^{n+1} + GWWT - \frac{q_w V_B}{\rho_{wsc}} \right)_{ijk} =$$

$$\frac{1}{\Delta t}\left[\left(\frac{V_p S_w}{B_w}\right)^{n+1}_{ijk} - \left(\frac{V_p S_w}{B_w}\right)^{n}_{ijk}\right] \quad . \quad . \quad . \quad . \quad (2\text{-}51)$$

$$\left(S_g \right)^{n+1}_{ijk} = 1 - \left(S_o \right)^{n+1}_{ijk} - \left(S_w \right)^{n+1}_{ijk} \quad . \quad . \quad (2\text{-}52)$$

Whenever the new pressures and saturation have been computed, these values are then considered the present values and the calculation is repeated till the end of simulation. In this way, the approximate numerical solution of the block oil simulator (three-phase, two-phase) and aquifer model may be obtained for an arbitarily long time. This procedure is known as the implicit pressure - explicit saturation (IMPES) method.

CHAPTER 3: SOLUTION METHODS FOR SOLVING SIMULTANEOUS EQUATIONS

Introduction

When Eq.(2.49) is applied at every grid point in the solution space of dimension II*JJ*KK number of blocks in the x, y, z - directions respectively (evaluating coefficient a_{ij} at time level n for the IMPES method), it gives rise to a linear system of equations of the form:

$$
\begin{aligned}
a^n_{1,1} P^{n+1}_1 + a^n_{1,2} P^{n+1}_2 + a^n_{1,3} P^{n+1}_3 + \cdots + a^n_{1,N} P^{n+1}_N &= B^n_1 \\
a^n_{2,1} P^{n+1}_1 + a^n_{2,2} P^{n+1}_2 + a^n_{2,3} P^{n+1}_3 + \cdots + a^n_{2,N} P^{n+1}_N &= B^n_2 \\
\cdots \quad \cdots \quad \cdots \quad \cdots \quad \cdots \quad \cdots \quad \cdots \quad \cdots \quad \cdots & \\
a^n_{N,1} P^{n+1}_1 + a^n_{N,2} P^{n+1}_2 + a^n_{N,3} P^{n+1}_3 + \cdots + a^n_{N,N} P^{n+1}_N &= B^n_N
\end{aligned}
\qquad (3\text{-}1)
$$

where

N = II*JJ*KK

n, n + 1 = old and new time levels respectively.

Using matrix notation to express Eq.(3.1) in a compact form, let

$$\underline{A} = \begin{bmatrix} a^n_{1,1} & a^n_{1,2} & a^n_{1,3} & \cdots & a^n_{1,N} \\ a^n_{2,1} & a^n_{2,2} & a^n_{2,3} & \cdots & a^n_{2,N} \\ \cdots & \cdots & \cdots & \cdots & \cdots \\ a^n_{N,1} & a^n_{N,2} & a^n_{N,3} & \cdots & a^n_{N,N} \end{bmatrix} \quad \ldots \quad (3\text{-}2)$$

$$\underline{P} = \begin{bmatrix} P_1^{n+1} \\ P_2^{n+1} \\ \cdots \\ P_N^{n+1} \end{bmatrix} \qquad \underline{B} = \begin{bmatrix} B_1^n \\ B_2^n \\ \cdots \\ B_N^n \end{bmatrix} \quad \ldots \quad (3\text{-}3)$$

Then Eq.(3.1) can be written as:

$$\underline{A}\ \underline{P} = \underline{B} \quad \ldots \qquad (3.4)$$

where

$\underline{A}$ = coefficient matrix (evaluated at time level n for the IMPES when solving pressure equation (2.49))

$\underline{P}$ = solution vector

$\underline{B}$ = known column vector

Various methods exist for solving Eq.(3.4) but generally there are only two basic methods namely: direct method and iterative method, each of which has its particular advantages and disadvantages.

3.1 Direct Method

Direct methods are those in which the solution to Eq.(3.4) is obtained after completion of a fixed number of operations. One of the well known direct method is Gaussian elimination. The basic idea of this method is to reduce the system of n equations in n unknowns of Eq.(3.1) to a system of (n − 1) equations in (n − 1) unknowns first; then it is again reduced to the system of (n − 2) equations in (n − 2) unknowns. This process is repeated until finally one equation in one unknown is obtained. Thus, this one unknown is determined. The remaining unknowns are determined by back substitution. Actually, this process performs the necessary row eliminations in such a way that matrix $\underline{A}$ transforms to an upper triangular matrix, which is easy to solve for $\underline{P}$ by backward substitution. Some variations of Gaussian method include Gauss-Jordan reduction that avoids the step of back substitution. Another technique is LU decomposition which involves factorization of matrix $\underline{A}$ into lower and upper traingular matrices $\underline{L}$ and $\underline{U}$ so that $\underline{P}$ can be determined in the following sequence of steps:

(1) Factorization

$$\underline{L} = \left[\ell_{ij} \right] \quad \text{and} \quad \underline{U} = \left[u_{ij} \right]$$

are determined in this step, where

$$\ell_{ij} = 0 \quad \text{for} \quad i < j \quad \text{and} \quad u_{ij} = 0 \quad \text{for} \quad i > j$$

(2) Solve $\underline{L}\ \underline{Z} = \underline{B}$ for $\underline{Z}$ using the forward substitution.

(3) Finally solve $\underline{U}\ \underline{P} = \underline{Z}$ for $\underline{P}$ using the backward substitution.

There are many ways to factor matrix $\underline{A}$, but a common way to factor $\underline{A}$ is to choose the diagonal elements for $\underline{U}$ be 1's. This procedure is called Crout's method (9). A number of solution techniques employed in reservoir simulators, both direct and iterative, have their basis in the LU decomposition concept. The reason this method is popular in programs is that storage space may be economized. Thee is no need to store the zeros in either L or U, and the 1's on the diagonal of U can also be omitted since these values are the same and known. We can store the essential elements of U where zeros appear in the L array. More importantly, after any element, a_{ij}, of $\underline{A}$ is once used, it never again appears in the equations, thus $\underline{A}$ can be used to store an element of either L or U.

$$\begin{bmatrix} a^{n}_{1,1} & a^{n}_{1,2} & \cdots & a^{n}_{1,N} \\ a^{n}_{2,1} & a^{n}_{2,2} & \cdots & a^{n}_{2,N} \\ \cdot & \cdot & \cdot & \cdot \\ a^{n}_{N,1} & a^{n}_{N,2} & \cdots & a^{n}_{N,N} \end{bmatrix} \Longrightarrow \begin{bmatrix} \ell_{1,1} & u_{1,2} & \cdots & u_{1,N} \\ \ell_{2,1} & \ell_{2,2} & \cdots & u_{2,N} \\ \cdot & \cdot & \cdot & \cdot \\ \ell_{N,1} & \ell_{N,2} & \cdots & \ell_{N,N} \end{bmatrix}$$

The efficiency of direct solution methods, however, depends on the ordering of unknown points $\underline{P}$ for the model grid that would give rise to different appearance of band width 'W' for $\underline{A}$. Because of the fact that amount of computational work involved in factorising $\underline{A}$ is strongly dependent on the size of W, it is essential to label the unknown $\underline{P}$ so as to minimise W to the least.

We would now examine two types of ordering namely: natural ordering (BAND) and alternate diagonal ordering (D4). Fig.(3.1) shows a natural ordering of points for a three-dimensional (4 * 3 * 2) grid, which generates a banded matrix $\underline{A}$ after Eq.(2.49) is applied at every grid point in the model (Fig.3.2) prescribing no flow on the boundary. If there are sources or sinks in the model, matrix $\underline{A}$ will be a little altered.

FIGURE (3.1)

Upon inspection of matrix A, the maximum band width 'W' containing nonzero elements is found to be:

$$W_{max} = 2 * JJ * KK + 1$$

$$\text{i.e} \qquad W_{max} = 2*3*2 + 1 = 13 \qquad (3\text{-}5)$$

To reduce the size of W to the least, it is seen from Eq.(3.5) that the longest side of grid should be aligned in the x-direction which would maximise the efficiency of the BAND algorithm. The specific equations used in BAND are:

Factorization

$$\ell_{ij} = a_{ij} - \sum_{k=L_1(i)}^{j-1} \ell_{ik}\, u_{kj}$$

$$j = L_1, L_1+1, \ldots, i \qquad (3\text{-}6)$$

$$u_{ij} = \left(a_{ij} - \sum_{k=L_3(j)}^{i-1} \ell_{ik} u_{kj}\right) \Big/ \ell_{ii}$$

$$j = i+1, i+2, \ldots, L_2(i) \qquad (3\text{-}7)$$

where

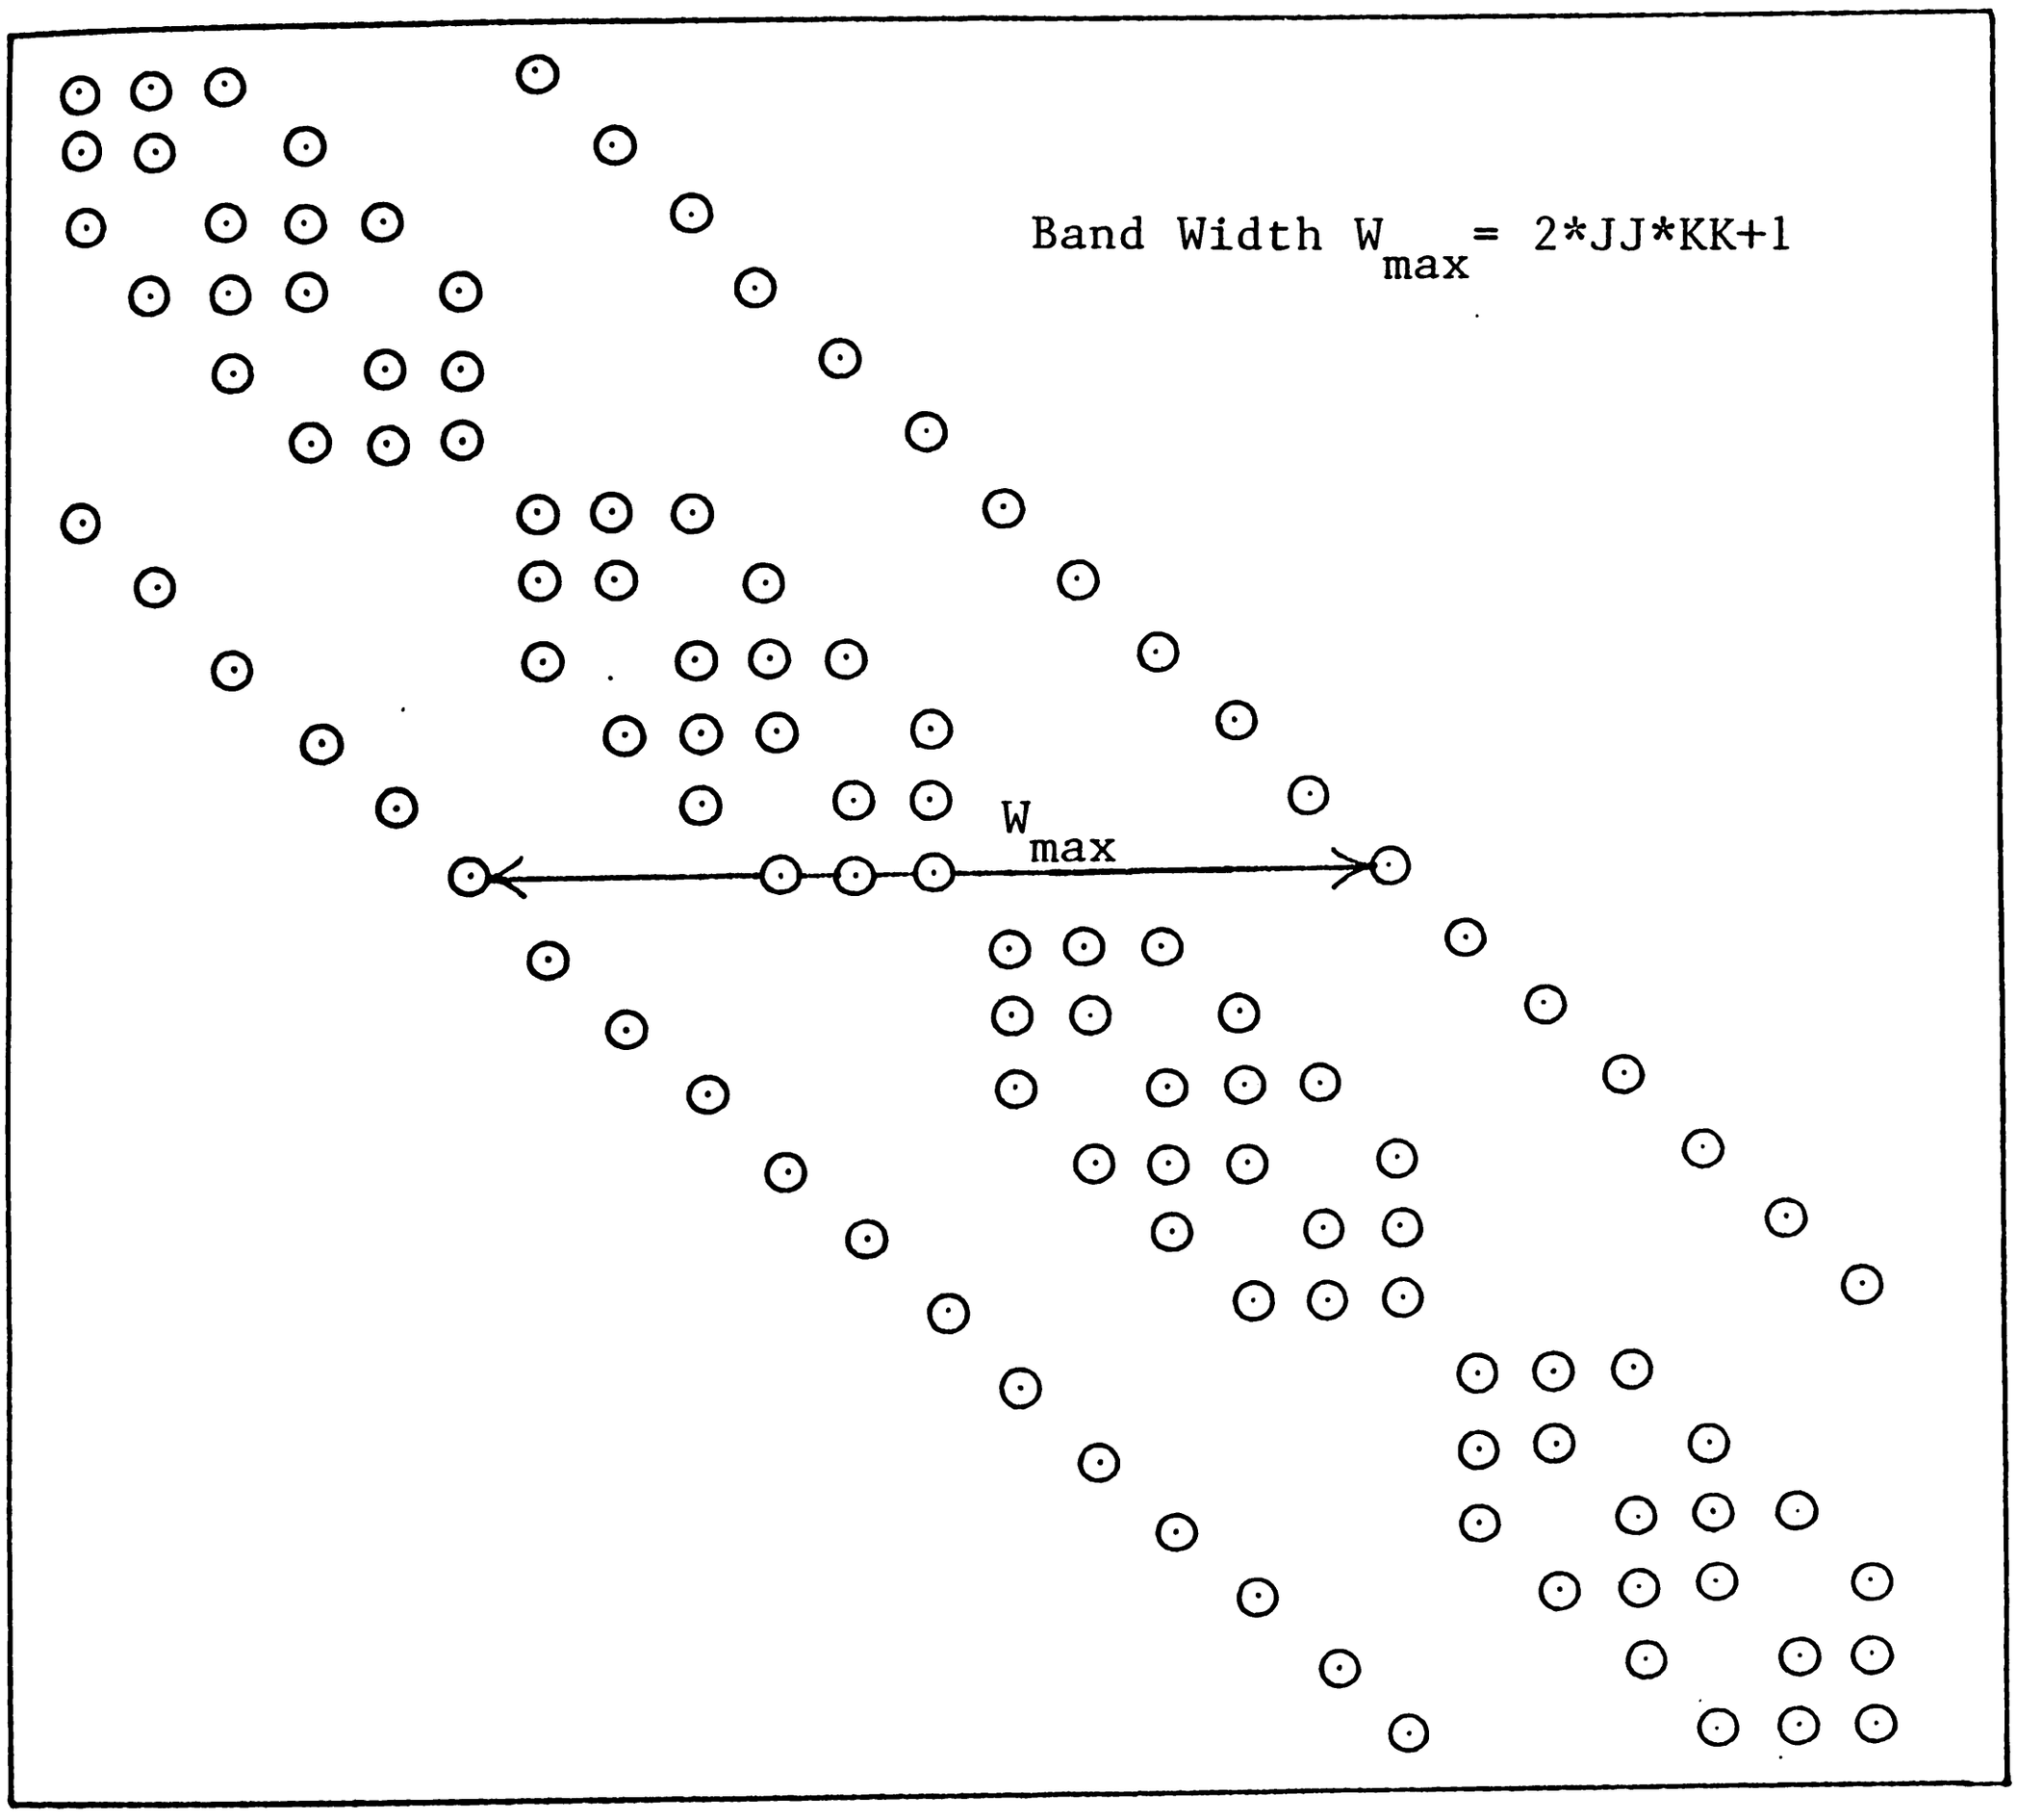

FIGURE (3.2)

$$\left.\begin{aligned} L_1(i) &= \max(i, i-(W-1)/2) \\ L_2(i) &= \max(N, i+(W-1)/2) \\ L_3(i) &= \max(1, j-(W-1)/2) \end{aligned}\right\} \quad \ldots \quad (3\text{-}8)$$

Forward Substitution

$$z_i = \left(B_i - \sum_{k=L_1(i)}^{i-1} \ell_{ik} z_k\right) / \ell_{ii}$$

$$i = 1,2,3, \ldots ,N \qquad (3\text{-}9)$$

Backward Substitution

$$P_i = z_i - \sum_{k=i+1}^{L_2(i)} u_{ik} P_k$$

$$i = N, N-1, \ldots ,2,1 \qquad (3\text{-}10)$$

Unlike natural ordering, the D4 ordering or alternate diagonal ordering (Fig.3.3), first employed by Price and Coats in the petroleum literature produces a substantial decrease in the subsequent matrix calculations. The concept of D4 ordering is such that any point P_{ijk} in a grid system is said to belong to a diagonal plane (m) if its indices satisfy the relation:

$$i + j + k = m \qquad \ldots(3.11)$$

FIGURE (3.3)

From this definition, it is evident that the smallest plane number is 3 while the largest number is M where M = II + JJ + KK

Now using D4 ordering to the 4*3*2 grid system, the new form of coefficient matrix A is developed as shown in Fig.(3.4). Upon inspection of Fig.(3.4), it is clearly seen that there are no nonzero terms below the main diagonal in the upper half portion of the matrix A. As a result, it reduces the total number of computations, especially when the matrix is large. However, D4 ordering might not be as efficient as natural ordering for small matrix A since some overhead computations are needed to set up the D4 ordering scheme.

In applying Gaussian elimination to matrix A, only left-hand quadrant needs to be zeroed out. In doing so, new nonzero elements are created in the lower right-hand quadrant. The upper half of matrix A would remain the same throughout the computation (Fig.3.5). To eliminate the left-hand quadrant below AA of Fig.(3.4), the program must be able to keep tracking where the lower diagonal block of nonzero entries is. This is accomplished by recognizing the following limits:

1. The lower diagonal block of nonzero entries starts at row (N + 1)/2 + 1 and ends at row N.

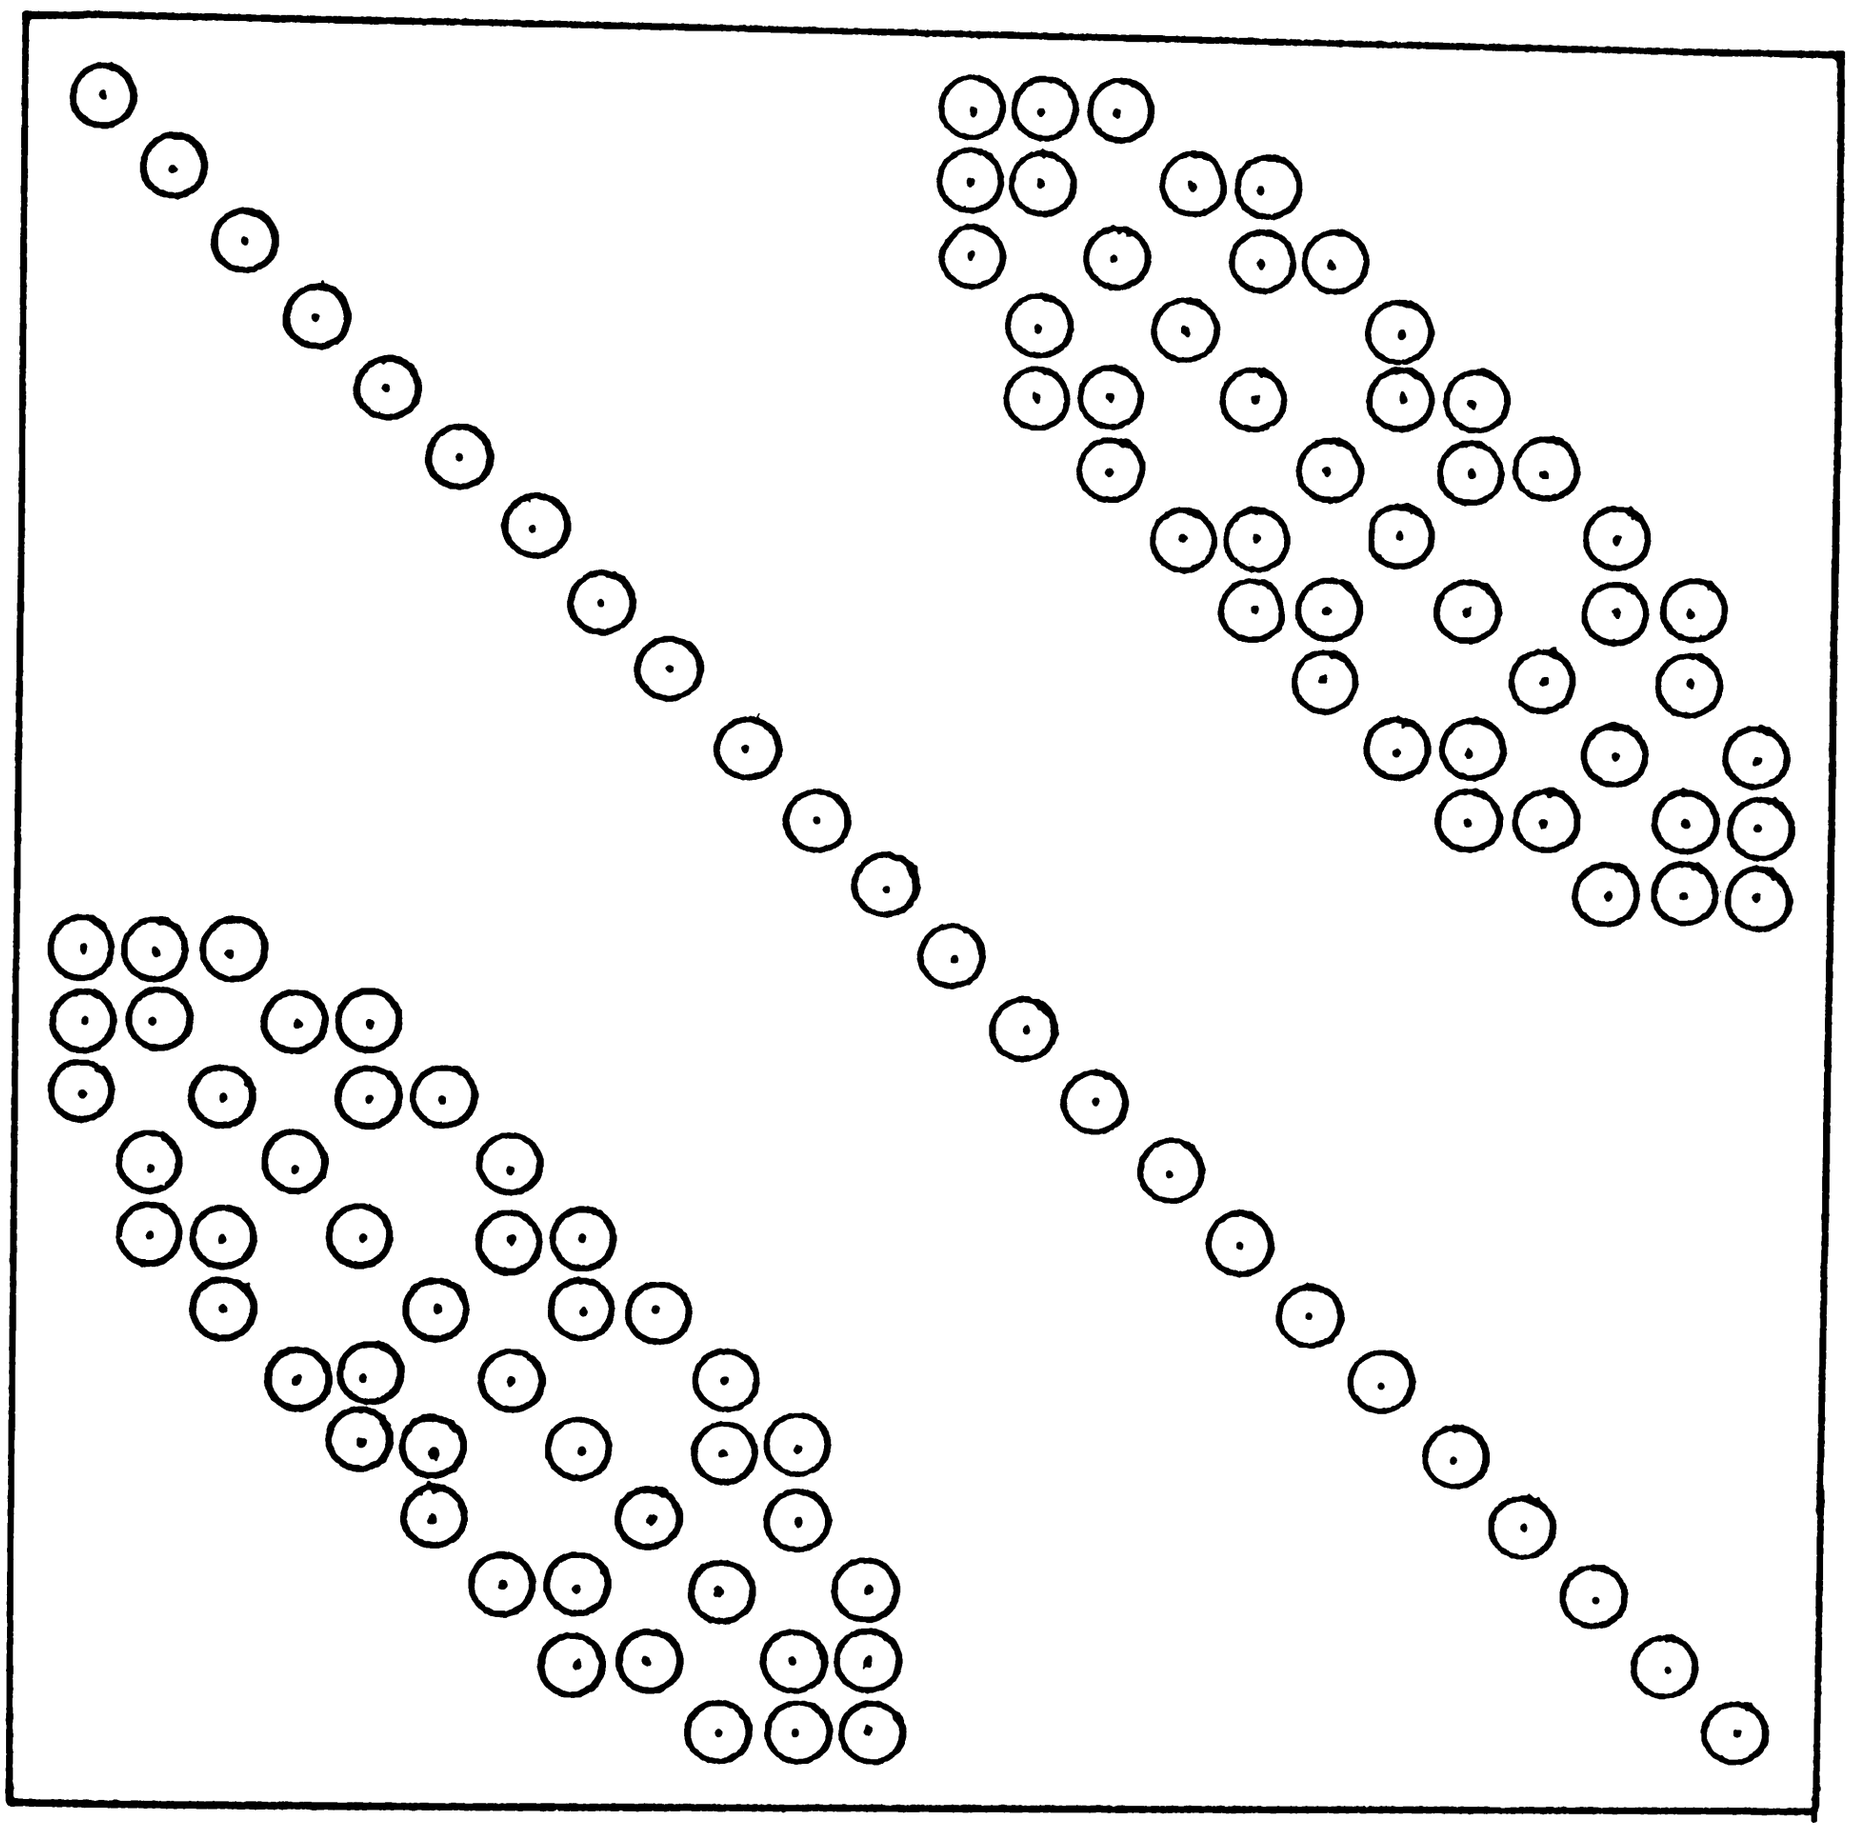

FIGURE (3.4)

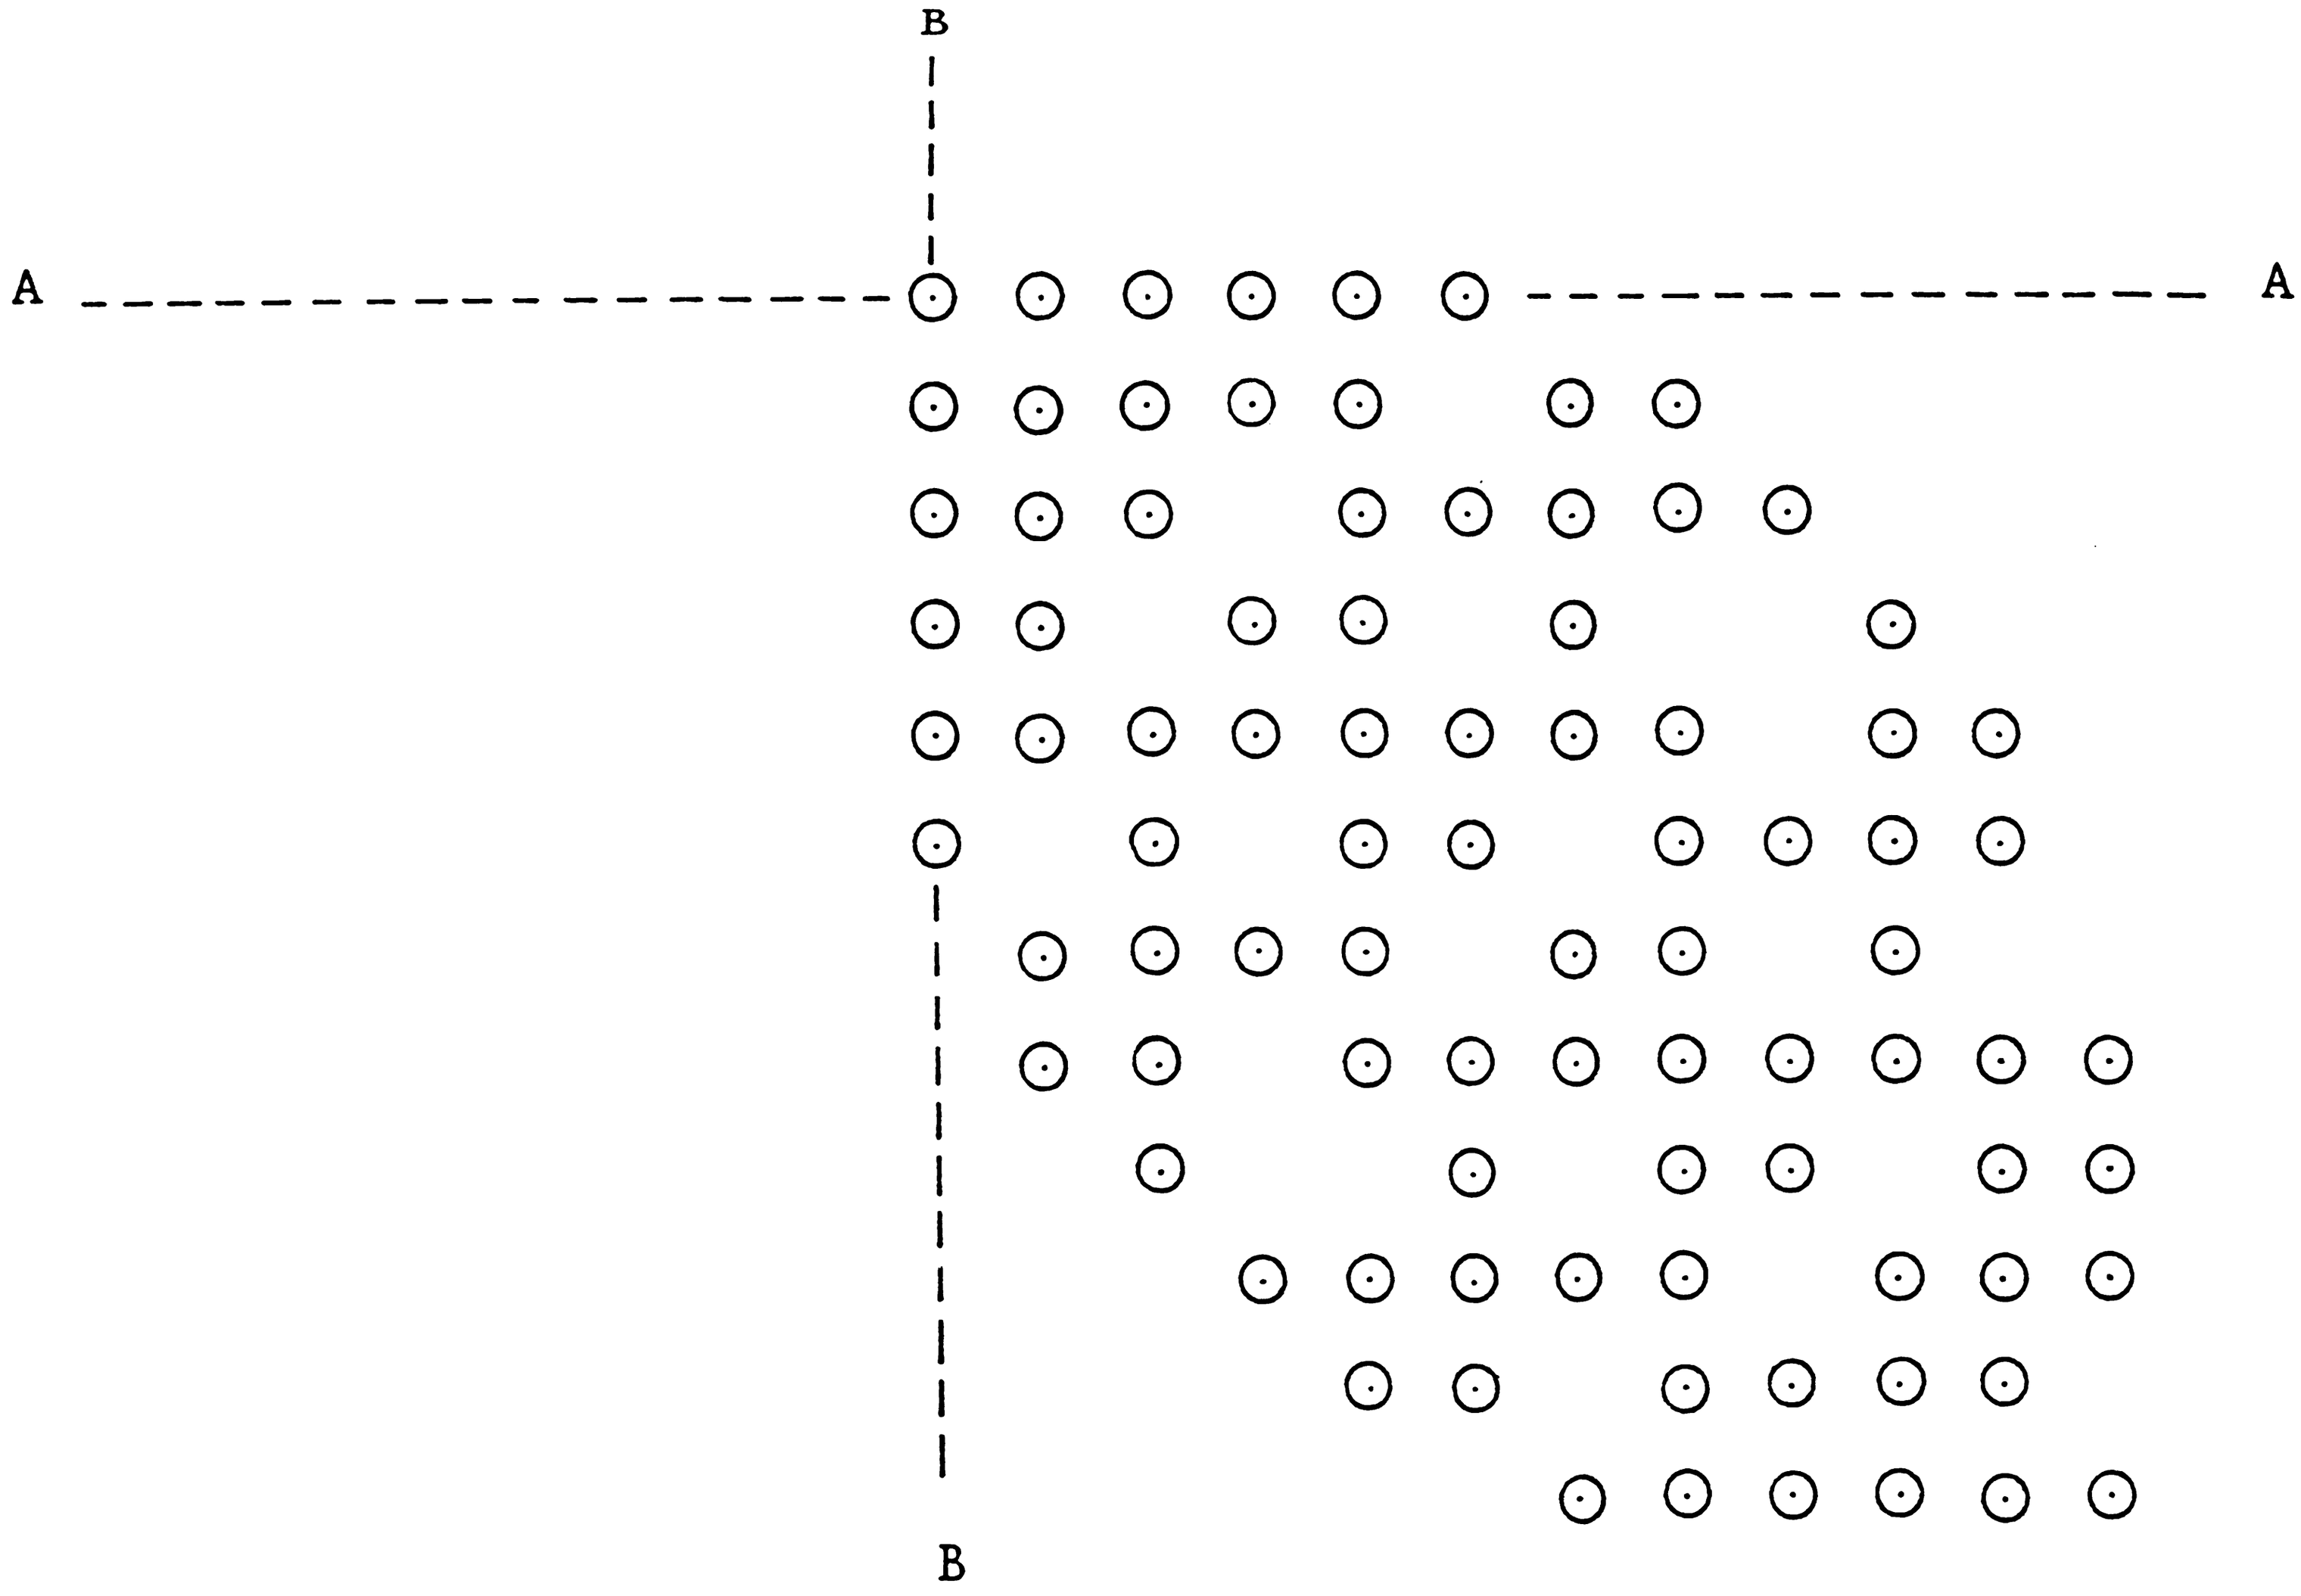

FIGURE (3.5)

2. The band width for this lower diagonal block is

   W_{lower} = JJ*KK + 1

3. There is a maximum of (JJ*KK+1)/2 + 1 nonzero entries in the first nonzero row of the lower diagonal block. For each subsequent row, the position of last nonzero entry in the row is increased by one.

After Gaussian elimination has been performed to zero-out the lower left-hand quadrant, we can solve for the unknown $\underline{P}$, starting from (N + 1)/2 + 1 to N, using a band width of 2*JJ*KK + 1 and BAND algorithm. Finally, backward substitution is used to solve for the remaining unknowns $\underline{P}$ above AA in Fig. (3.4); ie. P_1, P_2, P_3,....,$P_{(N-1)/2}$

3.2 Iterative Methods

Iterative methods are far most commonly used to solve a system of simultaneous equations in the reservoir simulators because they have distinct advantages over direct methods especially when N is very large and the system matrix is sparse. Iterative methods make use of an initial guess for the solution vector and iterates the system until some convergence criterion is reached. The iterative method, as opposed to the direct method of solving a set of simultaneous equations by elimination, is self-correcting if an error is made and has a considerable reduction of round-off error in the solution. More importantly, they do not require a large amount of computer storage.

Now considering the linear system given by Eq.(3.4), we would split the coefficient matrix $\underline{A}$ in such a way that

$$\underline{A} = \underline{D} - (\underline{D} - \underline{A}) \qquad \ldots(3.12)$$

where $\underline{D}$ is a diagonal matrix having the same diagonal entries as matrix $\underline{A}$.

Inserting Eq.(3.12) into Eq.(3.4) and rearranging yields

$$\underline{D}\ \underline{P} = (\underline{D} - \underline{A})\underline{P} + \underline{B} \qquad \ldots(3.13)$$

To begin our iterative procedure, we would label two time levels appropriately to the solution vector $\underline{P}$ so that we can substitute some initial guess into the right-hand side of Eq.(3.13) generating new approximations which are closer to the true values.

$$\underline{P}^{n+1} = \underline{D}^{-1}(\underline{D} - \underline{A})\underline{P}^{n} + \underline{D}^{-1}\underline{B} \qquad \ldots(3.14)$$

The new values are again substituted to Eq.(3.14) to generate a second approximation and the process is repeated until successive value of each of $\underline{P}$ are sufficiently alike. This iterative procedure is known as the point iterative Jacobi method. The algorithm for Jacobi iteration to compute each component of solution vector $\underline{P}$ can be outlined as follow:

$$P_i^{n+1} = \frac{B_i}{a_{ii}} - \sum_{\substack{j=1 \\ j\neq i}}^{N} \left(\frac{a_{ij}}{a_{ii}} P_j^n \right)$$

$$i = 1, 2, \ldots, N$$

$$n = 0, 1, 2, \ldots \qquad (3\text{-}15)$$

A sufficient condition for convergence is that

$$|a_{ii}| > \sum_{\substack{j=1 \\ j\neq i}}^{N} |a_{ij}| \qquad i = 1, 2, \ldots, N \qquad (3\text{-}16)$$

Jacobi method, however, does not make full use of the most recent estimates of $(P_i)^{n+1}$. In the above method, we calculated the second estimate of $(P_i)^{n+1}$ before we did the $(P_2)^{n+1}$, and new values of both $(P_1)^{n+1}$ and $(P_2)^{n+1}$ were available before we improved the value of $(P_3)^{n+1}$ In nearly all cases, the new values are better than the old, and should be used in preference to the proper values. When this is done, the method is known as the point iterative Gauss-Seidel method.

$$P_i^{n+1} = \frac{B_i}{a_{ii}} - \sum_{j=1}^{i-1} \left(\frac{a_{ij}}{a_{ii}} P_j^{n+1} \right) - \sum_{j=i+1}^{N} \left(\frac{a_{ij}}{a_{ii}} P_j^n \right) \qquad (3\text{-}17)$$

where

i = 1, 2, ..., N

n = 0, 1, 2,.....

Use of Eq.(3.17) can be applied (Peaceman (1977) for example) to a two-dimensional grid system for analysis. Eq. (3.4) can be written in another form as

$$d_{ij} P_{ij} - AW_{ij} P_{ij} - AE_{ij} P_{i+1,j} - AS_{ij} P_{i,j-1}$$
$$- AN_{ij} P_{i,j+1} = B_{ij} \quad . \quad . \quad . \quad (3-18)$$

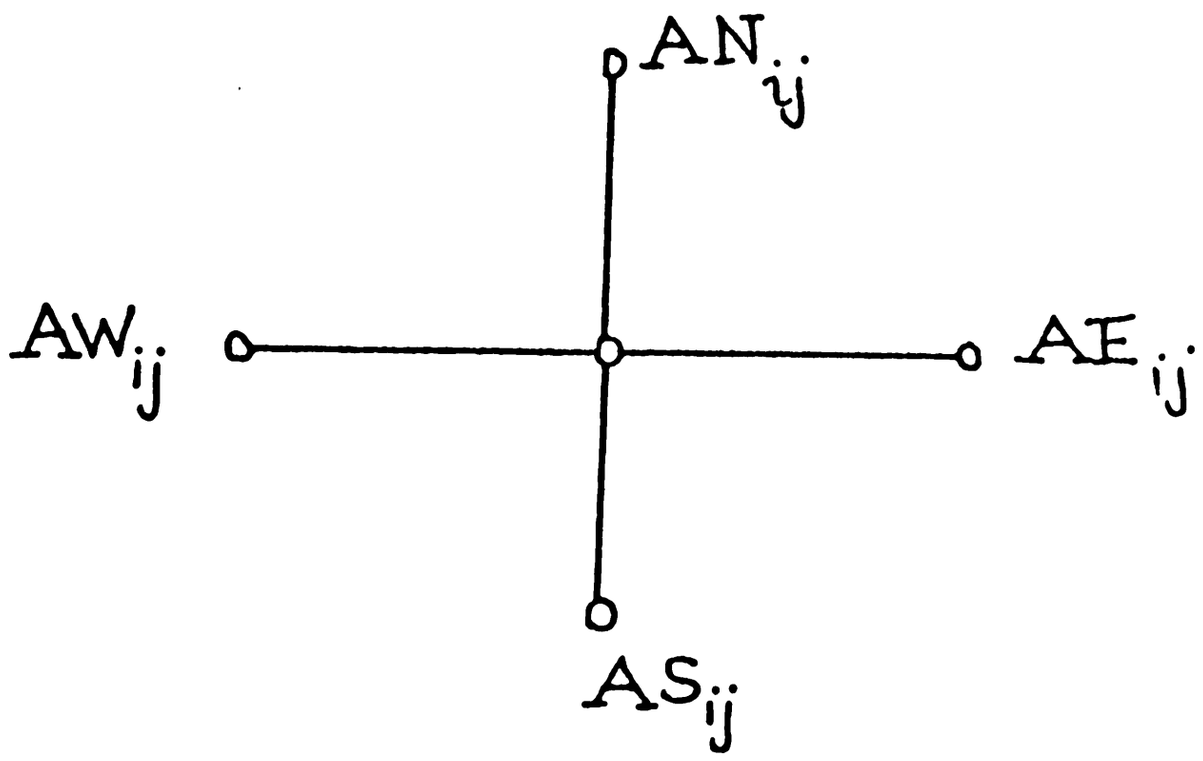

FIGURE (3.6)

Dividing Eq. (3.18) throughout by d_{ij} and rearranging gives

$$P_{ij} = (AW_{ij} P_{i-1,j} + AE_{ij} P_{i+1,j} + AS_{ij} P_{i,j-1}$$
$$+ AN_{ij} P_{i,j+1} + B_{ij}) / d_{ij} \quad . \quad . \quad . \quad (3-19)$$

Applying Gauss-Seidel procedure to Eq.(3.19), we can move from time level n to n+1. As in Fig.3.6, we shall consider the sequence wherein the points are taken in each row in order of increasing i, and then the rows are taken in order of increasing j. After traversing all the points, we start over again at the first point. A complete

iteration consists of one trip through all the points. It is schematically shown in Fig. (3.7). Referring 'k' as the number of counter for each complete iteration, $(P_{ij})^{k+1}$ (after the end of k iterations) can be found solving explicitly Eq.(3.19) as follow.

$$P_{ij}^{k+1} = (AW_{ij} P_{i-1,j}^{k+1} + AE_{ij} P_{i+1,j}^{k} + AS_{ij} P_{i,j-1}^{k+1} + AN_{ij} P_{i,j+1}^{k} + B_{ij})/d_{ij} \quad . \quad . \quad . \quad (3\text{-}20)$$

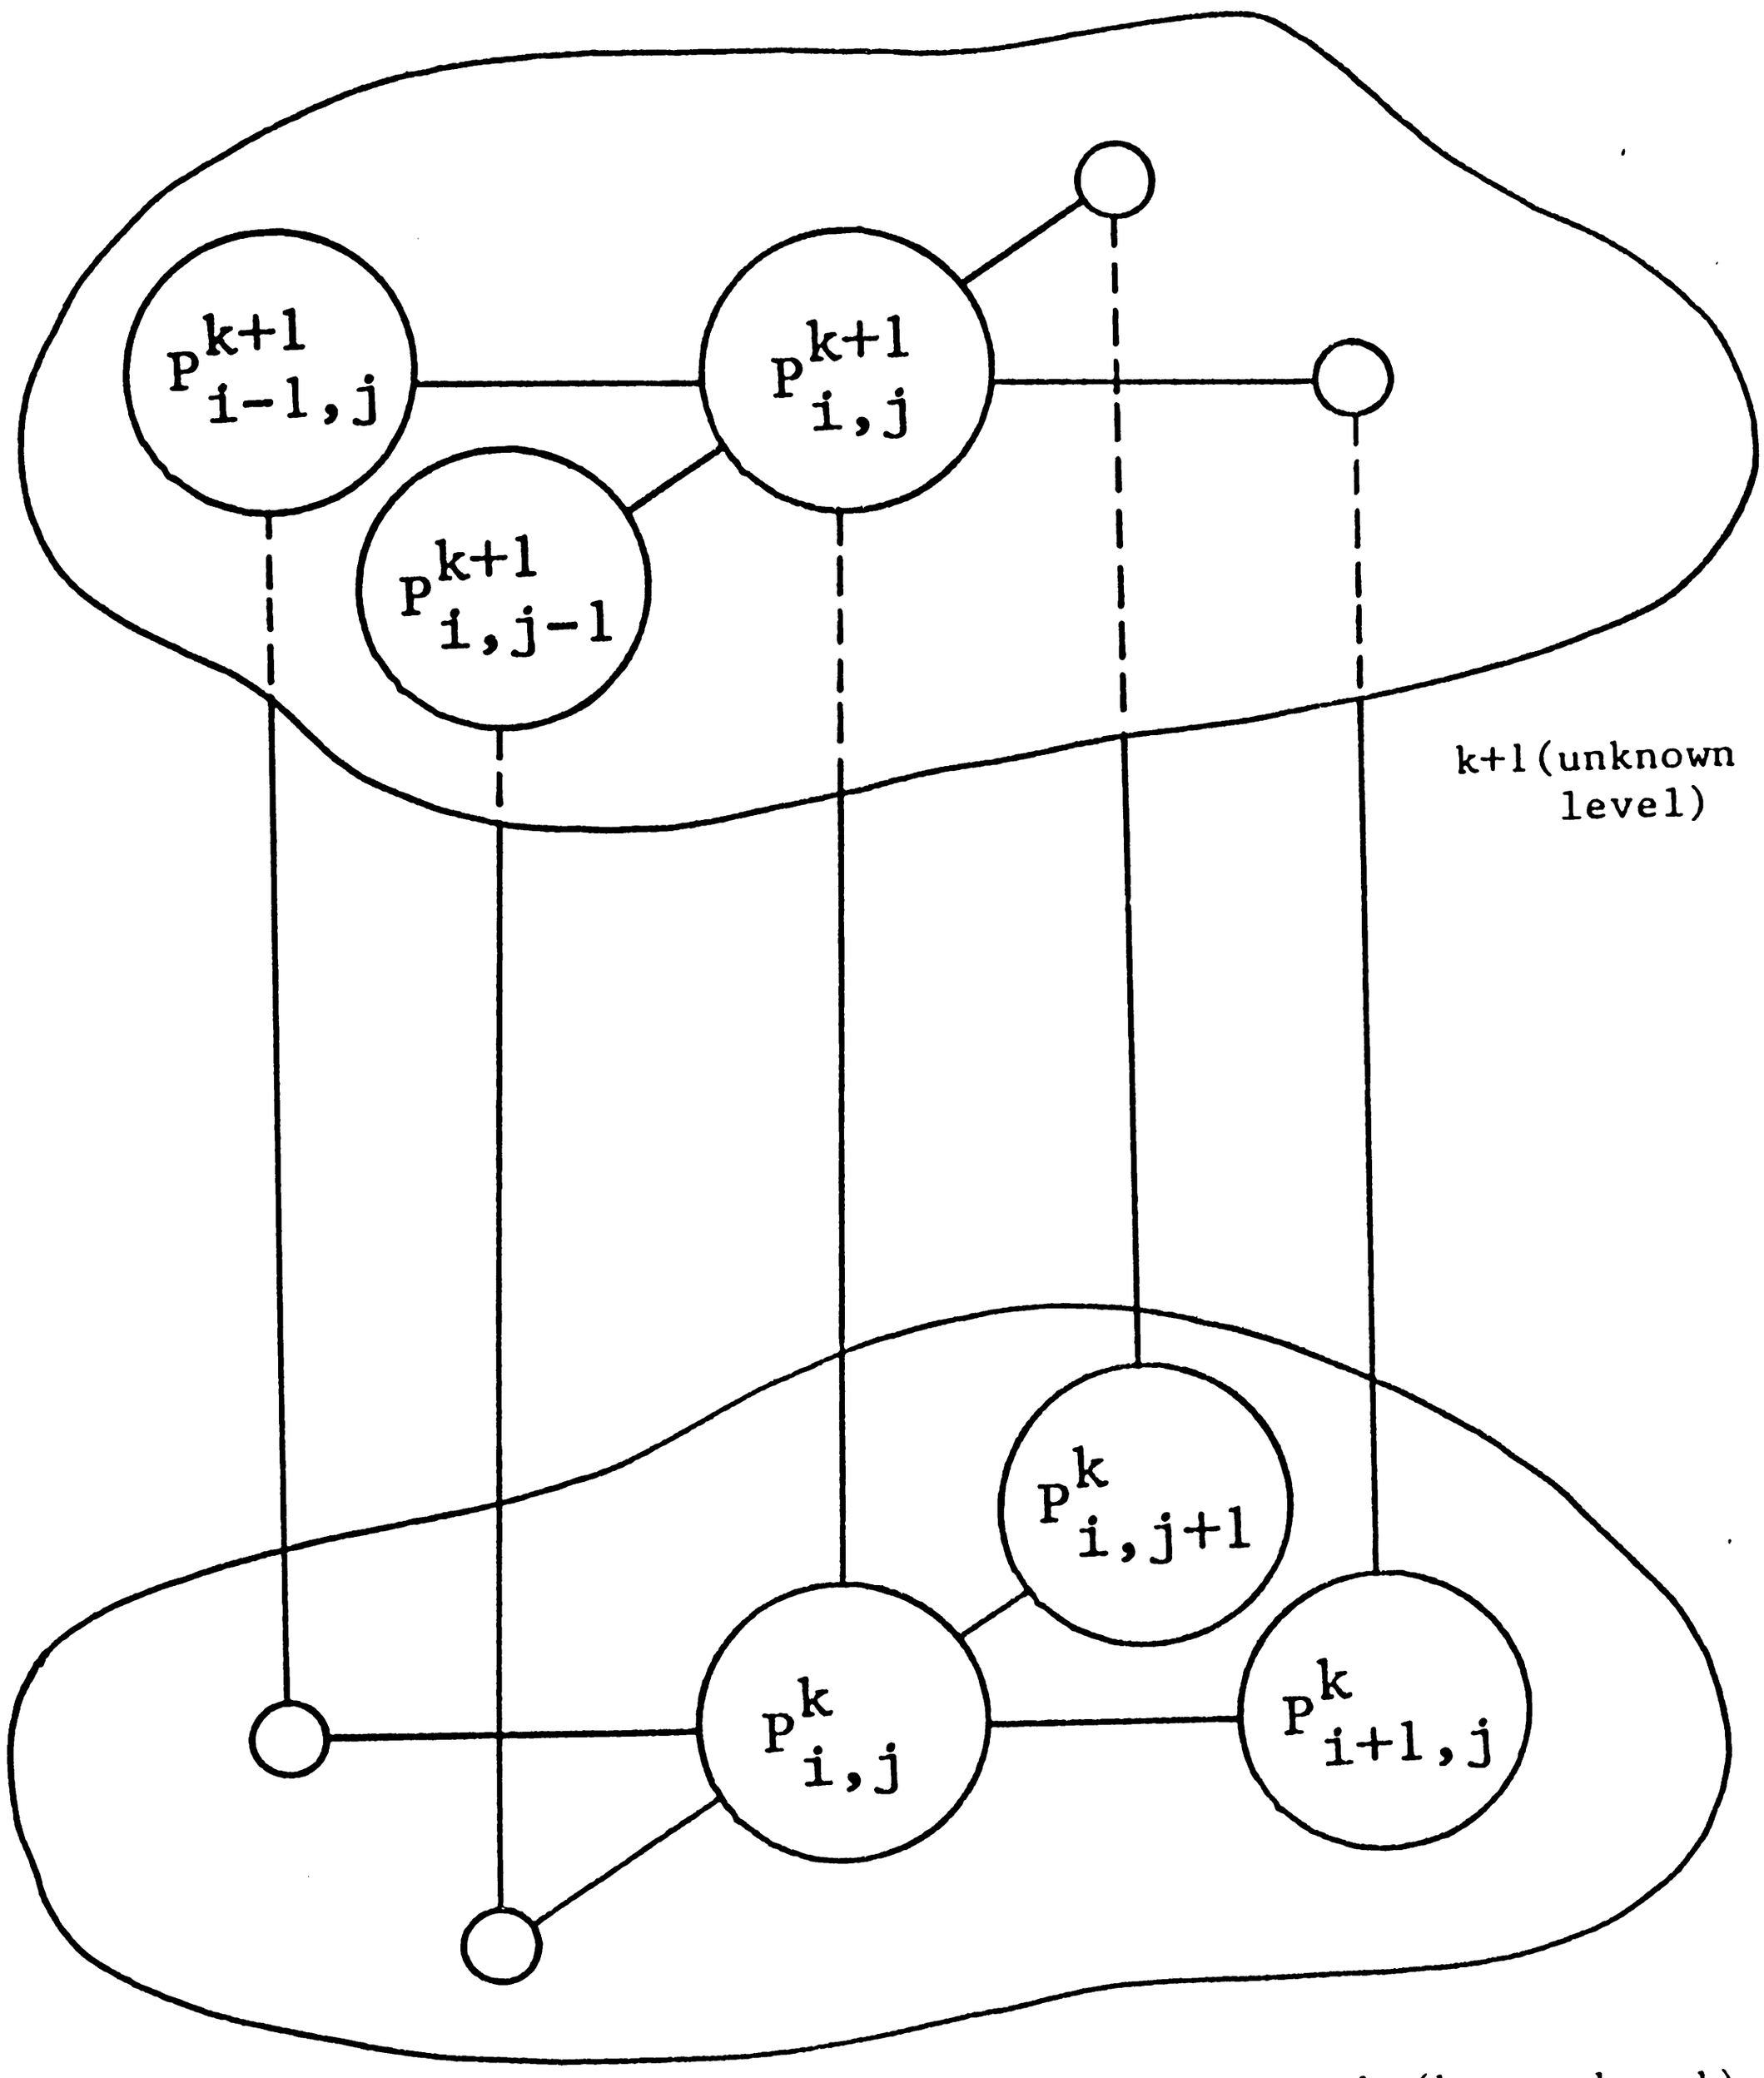
Another modification of this iterative method makes use of a weighting factor between old and new iterates. Applying a weighting factor w to Eq.(3.20), where $\omega > 1$, then

$$(P_{ij}^{k+1})_{SOR} = P_{ij}^{k} + \omega \left\{ (P_{ij}^{k+1})_{GS} - P_{ij}^{k} \right\} \quad . \quad . \quad (3\text{-}21)$$

where

$(P_{ij}^{k+1})_{GS}$ - elements of $\underline{P}$ after k iterations using Gauss-Seidel method.

$(P_{ij}^{k+1})_{SOR}$ - elements of $\underline{P}$ after k iterations using a weighting factor 'ω' to $(P_{ij}^{k+1})_{GS}$



$P^{k+1}_{i-1,j}$
$P^{k+1}_{i,j}$
$P^{k+1}_{i,j-1}$
k+1 (unknown level)
$P^{k}_{i,j+1}$
$P^{k}_{i,j}$
$P^{k}_{i+1,j}$
k (known level)

FIGURE (3.7)

This procedure is known as point successive overrelaxation method. Eq.(3.21) can be represented in matrix from by $\underline{A}\ \underline{P} = \underline{B}$, where we split the coefficient matrix $\underline{A}$ into three matrices as

$$\underline{A} = \underline{L} + \underline{D} + \underline{U} \qquad \ldots(3.22)$$

in which

$\underline{L}$ = a lower triangular matrix containing the elements of $\underline{A}$ below the main diagonal, namely, $-AW_{ij}$ and $-AS_{ij}$

$\underline{D}$ = diagonal matrix whose elements are the diagonal elements of $\underline{A}$, namely, d_{ij}

$\underline{U}$ = upper traingular matrix containing the elements of $\underline{A}$ above the main diagonal, namely, $-AE_{ij}$ and $-AN_{ij}$

Substituting Eq. (3.22) into $\underline{A}\ \ \underline{P}\ = \underline{B}$, we obtain

$$(\underline{L} + \underline{D} + \underline{U})\underline{P} = \underline{B} \qquad \ldots(3.23)$$

In Jacobi method, we represent Eq.(3.23) in matrix form as follows

$$\underline{D}\ \underline{P}^{k+1} = -\ \underline{L}\ \underline{P}^{k} - \underline{U}\ \underline{P}^{k} + \underline{B}$$

or

$$\underline{P}^{k+1} = D^{-1}(-\ \underline{L}\ \underline{P}^{k} - \underline{U}\ \underline{P}^{k} + \underline{B}) \qquad \ldots(3.24)$$

Applying Gauss-Seidel method to Eq.(3.24), we obtain

$$(\underline{P}^{k+1})_{GS} = \underline{D}^{-1}(-\underline{L}\ \underline{P}^{k+1} - \underline{U}\ \underline{P}^{k} + \underline{B}) \qquad \ldots(3.25)$$

If we apply a weighting factor 'ω' to Eq. (3.25), we obtain the point SOR.

$$\underline{D}\,\underline{P}^{k+1} = \underline{D}\,\underline{P}^{k} + \omega\left[\underline{D}(\underline{P}^{k+1})_{GS} - \underline{D}\,\underline{P}^{k}\right]$$

$$= \underline{D}\,\underline{P}^{k} + \omega(-\underline{L}\underline{P}^{k+1} - \underline{U}\underline{P}^{k} + \underline{B} - \underline{D}\,\underline{P}^{k}) \qquad (3\text{-}26)$$

Rearranging and solving for $\underline{P}^{k+1}$, we obtain

$$\left(\underline{P}^{k+1}\right)_{SOR} = -\left(\omega\underline{L} + \underline{D}\right)^{-1}\left[(\omega-1)\underline{D} + \omega\underline{U}\right]\underline{P}^{k}$$

$$+\left(\omega\underline{L} + \underline{D}\right)^{-1}\underline{B} \qquad . \qquad . \qquad . \qquad (3\text{-}27)$$

This procedure is known as the point successive overrelaxation method. The methods treated so far have been point iterative methods, which could be solved explicitly. As an extension to SOR method, we can use LSOR method with which we advance in such a way that all points in a line be solved first implicitly, and then these values would be appropriately weighted using 'ω'. As we move from line to line, the updated values of the unknowns from the previous line could be used (Fig.3.8).

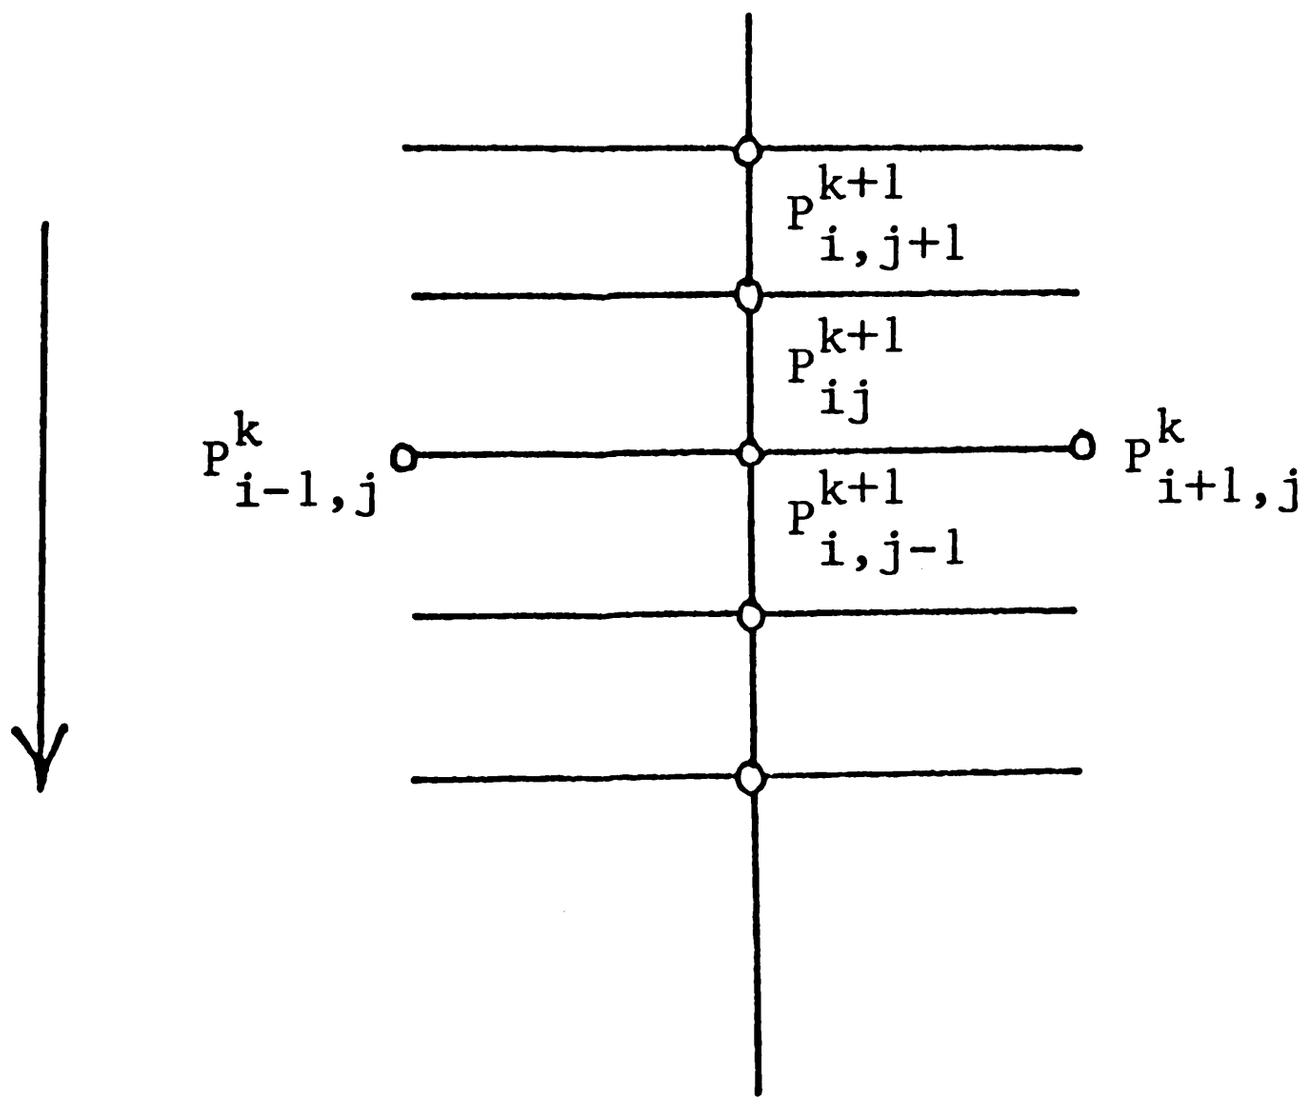


FIGURE (3.8)

$$P_{ij}^{k+1} = (AW_{ij} P_{i-1,j}^{k} + AE_{ij} P_{i+1,j}^{k} + AS_{ij} P_{i,j-1}^{k+1}$$

$$+ AN_{ij} P_{i,j+1}^{k+1} + B_{ij}) / d_{ij} \quad . \quad . \quad . \quad . \quad (3\text{-}28)$$

As soon as $(P_{ij})^{k\ 1}$ along the line are all calculated, they are overrelaxed using Eq.(3.21) before we advance to next line. This iterative method is known as line successive overrelaxation method (LSOR).

For closed boundary case, solution to Eq.(3.4) is difficult when the equations ae anisotropic; that is, when grid spacing is much longer in one direction than in the other. By anisotropic it means that two of the off diagonal coefficients in each equation are much larger than the other off-diagonal coefficients. Watts (10) describes an alternative method for use with anisotropic systems. It consists of a correction applied at each grid point in a line, coupled with LSOR method. This method is known as CLSOR, which is applied in our simulator.

Watt's method of additive corrections consists in adding to each P_{ij} in a column a constant, α_i, so that a 'corrected' value of $(P_{ij})^{k+1}$ is used as the starting point for the next iteration. Thus:

$$\left(P_{ij}^{k+1}\right)_{CLSOR} = \left(P_{ij}^{k+1}\right)_{LSOR} + \alpha_i \quad . \quad . \quad . \quad (3\text{-}29)$$

The α's are chosen so that the sum of the residuals for each column is reduced to zero. The basic idea of CLSOR can be explained briefly in the following sequence of steps:

1. $(P_{ij})_{GS}$ is determined first.

2. In second step, $(P_{ij})_{LSOR}$ is determined by

$$P_{ij}^{k+1} + \omega\left\{\left(P_{ij}^{k+1}\right)_{GS} - \left(P_{ij}^{k}\right)\right\}$$

3. Solve implicitly Eq.(3.30) for Watt's correction factor α_i:

$$\alpha_{i-1}\sum_{j=1}^{JJ} AW_{ij} + \alpha_i \sum_{j=1}^{JJ}\left(AS_{ij} + AN_{ij} - d_{ij}\right) +$$

$$\alpha_{i+1}\sum_{j=1}^{JJ} AE_{ij} = \sum_{j=1}^{JJ} R_{ij}^{k+1} \quad . \quad . \quad . \quad (3\text{-}30)$$

where

$$R_{ij}^{k+1} = d_{ij}(P_{ij}^{k+1})_{GS} - AW_{ij} P_{i-1,j}^{k+1} - AE_{ij} P_{i+1,j}^{k+1} -$$

$$AS_{ij} P_{i,j-1}^{k+1} - AN_{ij} P_{i,j+1}^{k+1} - B_{ij} \quad . \quad . \quad (3\_31)$$

4. Then $(P^{k+1}{}_{ij})_{LSOR}$ is corrected in a specified line by adding α_i.

$$(P_{ij}^{k+1})_{CLSOR} = (P_{ij}^{k+1})_{LSOR} + \alpha_i \qquad \ldots(3.32)$$

5. In such fashion, CLSOR can be applied to three dimensions, where its use shows to be fast in solving simulator equations.

CHAPTER 4: TREATMENT OF WELLS IN A SIMULATOR

Introduction

There are essentially two methods for treating individual wells in a simulator: by rate constraint, or by pressure constraint. However, very few papers have appeared in the literature about representing wells in numerical simulators (11, 12). We use these sources to construct the well model.

4.1 Rate Constraint Representation

Assume that we want to represent an oil production well in the simulator. We can write for oil flow rate

$$Q_o = \frac{q_o V_B}{\rho_{osc}} \qquad (4-1)$$

where

Q_o - volumetric oil flow rate at standard conditions

V_B - bulk value of the grid block containing the well

q_o - sink term

ρ_{osc} - oil density at standard condition

Employing the productivity index (PI) concept, Eq. (4.1) can also be written as

$$Q_o = PI\left(\frac{\lambda_o}{B_o}\right)(P_e - P_{wf}) \quad . \quad . \quad . \quad (4\text{-}2)$$

where

P_e = reservoir pressure, which is usually substituted by well grid block pressure 'P'

P_{wf} = flowing bottom-hole pressure which is less than P_e for production

Substituting 'P' for P_e in Eq.(4.2), we obtain

$$Q_o = PI\left(\frac{\lambda_o}{B_o}\right)(P - P_{wf}) \quad . \quad . \quad . \quad (4\text{-}3)$$

The variables in Eq.(4.3) are $Q_o = P$, while the remaining terms are considered to be known parameters. When Q_o or Q_t is specified, it is directly used in the pressure equation to obtain 'P'. There are three cases for representing rate constrainted wells:

1. Oil production rate (Q_o) specified
2. Total production rate (Q_t) specified
3. Injection rate specified

1. Oil Production Rate Specified

If the well of interest is completed in K layers and producing the total oil rate Q_o, the oil production rate from Kth layer is determined as

$$\left[Q_o\right]_k = Q_o \frac{\left[PI\left(\frac{\lambda_o}{B_o}\right)\right]_k}{\sum_{k=1}^{KK}\left[PI\left(\frac{\lambda_o}{B_o}\right)\right]_k} \quad \ldots \quad (4\text{-}4)$$

The water and gas production rates from the layer are related to $[Q_o]_k$ by the following equations:

$$\left[Q_w\right]_k = \left[Q_o\right]_k \left(\frac{\lambda_w B_o}{\lambda_o B_w}\right)_k \quad . \quad . \quad . \quad (4\text{-}5)$$

and

$$\left[Q_g\right] = \left[Q_o\right]_k \left[\left(\frac{\lambda_g B_o}{\lambda_o B_g}\right)_k + \left(R_{so}\right)_k\right] +$$

$$\left[Q_w\right]_k \left(R_{sw}\right)_k \quad . \quad . \quad . \quad (4\text{-}6)$$

Since PI's may be specified by layer in above equations, we are able to take into account permeability contrast in the model.

2. Total Production Rate Specified

When the total production rate Q_t other than Q_o is specified, we first compute the phase mobility ratios for all layers before determining the layered production rates. If α_{ot}, α_{wt}, α_{gt} denote the oil, water and gas mobilities respectively for all layers, we can determine them as follows:

$$\alpha_{ot} = \sum_{k=1}^{KK} \left(\frac{\lambda_o}{\lambda_o + \lambda_w + \lambda_g} \right)_k \quad \cdots \quad (4-7)$$

$$\alpha_{wt} = \sum_{k=1}^{KK} \left(\frac{\lambda_w}{\lambda_o + \lambda_w + \lambda_g} \right)_k \quad \cdots \quad (4-8)$$

$$\alpha_{gt} = \sum_{k=1}^{KK} \left(\frac{\lambda_g}{\lambda_o + \lambda_w + \lambda_g} \right)_k \quad \cdots \quad (4-9)$$

We now compute the total oil rate Q_o as

$$Q_o = \left(\frac{\alpha_{ot}}{\alpha_{ot} + \alpha_{wt} + \alpha_{gt}} \right) Q_t \quad \ldots \quad (4\text{-}10)$$

Having calculated for Q_o, we simply proceed as in Eq.(4.4) through Eq.(4.6) to obtain $[Q_o]_k$, $[Q_w]_k$ and $[Q_g]_k$.

3. Injection Rate Specified

If the well is a water or gas injector, we must first specify the total water or gas injection rates as Q_w or Q_g repsectively, and well injectivity indexes (WI) for each layer. The injection rate for each layer can be determined by:

$$\left[Q_w\right]_k = Q_w \frac{\left[WI(\lambda_o+\lambda_w+\lambda_g)\right]_k}{\sum_{k=1}^{KK}\left[WI(\lambda_o+\lambda_w+\lambda_g)\right]_k} \quad \cdot \quad \cdot \quad (4\text{-}11)$$

and

$$\left[Q_g\right]_k = Q_g \frac{\left[WI(\lambda_o+\lambda_w+\lambda_g)\right]_k}{\sum_{k=1}^{KK}\left[WI(\lambda_o+\lambda_w+\lambda_g)\right]_k} \quad \cdot \quad \cdot \quad (4\text{-}12)$$

It is important to note that allocation of injection fluids is based on total mobilities rather than injected fluid mobility. This is necessary for the following reason. If an injector is placed in a block where the relative permeability to the injection fluid is zero, then simulator using injection fluid mobility only would prohibit fluid injection, even though a real well would allow fluid injection. To avoid the unrealistic result of no fluid injection, the total mobility of the block is used.

Pressure Constraint Representation

When a well is pressure constrainted, Eq.(4.3) is used in place of Q_o in the pressure equation. After the pressure equation has been solved, the subsequent well block pressure is then substituted into Eq.(4.3) from which Q_o is determined. There are two cases for representing pressure constrainted wells.

1. Implicit pressure constraint
2. Explicit pressure constraint

4.2 Implicit Pressure Constraint

The source or sink terms in Eq.(4.3) may be written as

$$\frac{q_p V_B}{\varrho_{psc}} = \left[PID\left(\frac{\lambda_p}{B_p}\right)\right]^n \left(P^{n+1} - P_{wf}\right) \quad . \quad . \quad (4\text{-}13)$$

where

P = phase

PID = PI if the well is a producer and $P^{n+1} > P_{wf}$

PID = WI if the well is an injector and $P^{n+1} < P_{wf}$

Substituting Eq.(4.13) for the appropriate oil, water and gas phases into the pressure equation, we can implicitly solve for pressure. Then, the computed pressure P^{n+1} is replaced in Eq.(4.13) to yield rates. This is accomplished by the following sequence:

$$(E_{ijk})^{new} = (E_{ijk})^{old} - CPI \quad . \quad . \quad . \quad (4\text{-}14)$$

and

$$(B_{ijk})^{new} = (B_{ijk})^{old} - CPI * P_{wf} \quad . \quad . \quad (4\text{-}15)$$

where

$$CPI = 5.615(PID)_k \left[(B_o - B_g R_{so}) \frac{\lambda_o}{B_o} + (B_w - B_g R_{sw}) \frac{\lambda_w}{B_w} + B_g \left(\frac{\lambda_g}{B_g} \right) \right] \quad . \quad . \quad (4\text{-}16)$$

It is important to note that the new E and B terms are defined immediately before solving the linear system of pressure equations and after the E and B matrices defined by first in the pressure equation are computed.

4.3 Explicit Pressure Constraint

For oil production wells, the oil rate from the k*th* layer is given by

$$\left[Q_o\right]_k = \left[PID\left(\frac{\lambda_o}{B_o}\right)\right]_k^n \left(P^n - P_{wf}\right)_k \quad . \quad . \quad . \quad (4\text{-}17)$$

where

PID = PI and the explicit pressure P^n is used.

If $P^n < P_{wf}$, then the well is shut in. When $P^n > P_{wf}$, $[Q_o]_k$ is calculated and then substituted into Eqs. (4.5) and (4.6) to find $[Q_w]_k$ and $[Q_g]_k$ respectively.

For injection wells, the injection rate for a water or gas injection well is determined by

$$\left[Q_p\right]_k = \left[PID\left(\frac{\lambda_o + \lambda_w + \lambda_g}{B_p}\right)\right]^n \left(P^n - P_{wf}\right)_k \quad (4\text{-}18)$$

where PID = WI and P = phase. Fluid injection occurs when $P^n < P_{wf}$. If $P^n > P_{wf}$, the injection well is shut in. Total mobility is used for the injection well rate calculation.

4.4 Layer Flow Index (PID)

Layer flow index (PID) can be estimated by Peaceman (13,14) equation as:

$$\left[PID\right]_k = \left[\frac{0.00708\,Kh}{\ln\left(\frac{r}{r_w}\right) - \frac{1}{2} + S}\right]_k \qquad (4\text{-}19)$$

where

K = absolute permeability of layer k, md

h = layer thickness, ft

r_w = wellbore radius, ft

r = equivalent radius of grid block containing the well

s = skin factor, dimensionless

In reservoir simulation, the horizontal dimensions of any grid block containing a well are always much larger than the wellbore radius of that well. It long has been recognized that the pressure calculated for a well block will be greatly different from the flowing bottom-hole pressure of the modelled well. Peaceman has developed the relation between the equivalent radius of a well block to the dimensions of block itself for the cases when Δx and Δy are equal and not equal.

For a square grid (ie. $\Delta x = \Delta y$),

$$r \simeq 0.2\,\Delta x \qquad (4\text{-}20)$$

This equation is valid for both steady state and transient conditions. Substituting the value of r into Eq.(4.19), we obtain

$$\left[PID\right]_k = \left[\frac{0.00708\,Kh}{\ln\left(\frac{0.2\Delta x}{r_w}\right) - \frac{1}{2} + S}\right]_k \qquad (4\text{-}21)$$

Coupling '½' with the logarithmic term,

$$(PID)_k = \left\{\frac{0.00708\,Kh}{\ln\left(\frac{0.121\,\Delta x}{r_w}\right) + S}\right\}_k \qquad (4\text{-}22)$$

For nonsquare grid (ie. $\Delta x \neq \Delta y$),

$$r \simeq 0.14 \sqrt{(\Delta x)^2 + (\Delta y)^2} \quad . \quad . \quad . \quad (4\text{-}23)$$

Substituting Eq.(4.23) into Eq.(4.19), we obtain

$$\left[PID\right]_k = \left[\frac{0.00708\, Kh}{\ln\left(\frac{0.14\sqrt{(\Delta x)^2+(\Delta y)^2}}{r_w}\right) - \frac{1}{2} + S}\right]$$

or

$$\left[PID\right] = \left[\frac{0.00708\, Kh}{\ln\left(\frac{0.0849\sqrt{(\Delta x)^2+(\Delta y)^2}}{r_w}\right) + S}\right] \quad . \quad . \quad . \quad (4\text{-}24)$$

CHAPTER 5: COMPUTER CODES

Introduction

This chapter describes computer codes for three kinds of three-dimensional, multiphase reservoir simulators namely:

1. GOWSIM (Three-dimensional, three-phase black oil simulator)
2. GWSIM (Three-dimensional, gas-water reservoir simulator)
3. WSIM (Three-dimensional, single phase aquifer simulator)

All the programs simulate isothermal, darcy flow in three dimensions. They assume reservoir fluids can be described by fluid phases of constant composition with physical properties that depend on pressure only. Technically, all the programs are the finite-difference, implicit pressure-explicit saturation (IMPES) numerical simulators using direct (BAND) and iterative line successive overrelaxation with additive corrections (CLSOR) solution methods for solving systems of algebraic equations. The well model in the simulator allows specification of rate or pressure constraints on well performance, and the user is free to add or recomplete wells during simulation.

5.1 General Program Overview

The data input section is divided into two parts:

1. Initialization data section
2. Recurrent data section

The initialization data includes:

(i) the reservoir model grid dimensions and geometry

(ii) the porosity distribution within the reservoir

(iii) the permeability distribution within the reservoir

(iv) fluid PVT data

(v) the rock relative permeability and capillary pressure data

(vi) initial pressure and saturation distributions within the reservoir

(vii) specification of solution method and

(viii) various run control parameter.

The initialization data are read only once at the beginning of simulation. The way they must be read is explained in the next section and the nomenclatures of the subroutines in the simulator.

The recurrent data includes:

(i) the location and initial specifications of wells in the model

(ii) time step control information for advancing simulation through time

(iii) a schedule of individual well rate and/or pressure performance

(iv) changes in well completions and operations over time and

(v) controls on the type and frequency of printout information provided by the simulator.

Throughout the input data file, title cards or input data descriptive lines are read before each major and many minor sections of input data. These cards are used to serve as delineators to make the input data file easier to read and edit. All data values can be read under free format input that allows for easier reading, but results are printed under fixed format. The common block file allows the user all re-dimensioning to be done simply by changing the subsequent parameters in the common block file as desired with no need to recompile the main program. However, care must be taken to check if the parameters in the common block file match with the input data before starting the simulation run.

If a full grid of input values (II*JJ*KK) must be read for a particular model, the following input order must be followed. Each layer will be laid out as shown below, and Z-direction values will increase going down.

I = 1 I = 2 I = 3

J = 1

J = 2

.

.

5.2 General Flow Chart of GOWSIM

Before we present the computer algorithms for simulators, the following flow chart may explain in general how the pressure equation is developed and used to determine the pressures and saturations within the reservoir. It implies for simulation of three-dimensional, three-phase black oil reservoir using the IMPES method. When all the oil terms in the pressure equation are deleted appropriately, what we would get is called the gas-water reservoir simulator. Similarly we can derive a single-phase, water reservoir simulator from the gas-water simulator.

Conservation of Mass

$$-\nabla.(\vec{J}_p) - q_p = \frac{\partial C_p}{\partial t}$$

Fluid Fluxes

$$(\vec{J}_o) = \frac{\rho_{osc}}{B_o}\vec{v}_o \qquad (\vec{J}_w) = \frac{\rho_{wsc}}{B_w}\vec{v}_w$$

$$(\vec{J}_g) = \frac{\rho_{gsc}}{B_g}\vec{v}_g + R_{so}\frac{\rho_{gsc}}{B_o}\vec{v}_o + R_{sw}\frac{\rho_{gsc}}{B_w}\vec{v}_w$$

Phase Concentrations

$$C_o = \frac{\phi \rho_{osc} S_o}{B_o}$$

$$C_w = \frac{\phi \rho_{wsc} S_w}{B_w}$$

$$C_g = \phi \rho_{gsc}\left(\frac{S_g}{B_g} + R_{so}\frac{S_o}{B_o} + R_{sw}\frac{S_w}{B_w}\right)$$

Coupling the Above Equations

$$-\nabla\cdot\left(\frac{\vec{v}_o}{B_o}\right)-\frac{q_o}{\rho_{osc}}=\frac{\partial}{\partial t}\left(\frac{\phi S_o}{B_o}\right)$$

$$-\nabla\cdot\left(\frac{\vec{v}_w}{B_w}\right)-\frac{q_w}{\rho_{wsc}}=\frac{\partial}{\partial t}\left(\frac{\phi S_w}{B_w}\right)$$

$$-\nabla\cdot\left(\frac{\vec{v}_g}{B_g}+\frac{R_{so}\vec{v}_o}{B_o}+\frac{R_{sw}\vec{v}_w}{B_w}\right)-\frac{q_g}{\rho_{gsc}}=$$

$$\frac{\partial}{\partial t}\left[\phi\left(\frac{S_g}{B_g}+R_{so}\frac{S_o}{B_o}+R_{sw}\frac{S_w}{B_w}\right)\right]$$

Rate Equation (Darcy's Law)

$$\vec{v}_p=-\overleftrightarrow{K}\cdot\lambda_p\nabla\left(P_p-\frac{\rho_p z}{144}\right)$$

$$\lambda_p=\frac{k_{rp}}{\mu_p}$$

Phase Densities (Equation of State)

$$\rho_o = \frac{1}{B_o}\left(\rho_{osc} + R_{so}\rho_{gsc}\right)$$

$$\rho_w = \frac{1}{B_w}\left(\rho_{wsc} + R_{sw}\rho_{gsc}\right)$$

$$\rho_g = \frac{\rho_{gsc}}{B_g}$$

Capillary Pressures

$$P_{cow} = P_o - P_w$$

$$P_{cgo} = P_g - P_o$$

Oil Phase Equation

$$\nabla . \overleftrightarrow{K} . \left(\frac{\lambda_o}{B_o}\right) \nabla \left(P_o - \frac{\rho_o z}{144}\right) - \frac{q_o}{\rho_{osc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_o}{B_o}\right) = L_o$$

Let $CG_o = -\nabla . \overleftrightarrow{K} . \left(\frac{\lambda_o}{B_o}\right) \nabla \left(\frac{\rho_o z}{144}\right)$; then

$$\nabla . \overleftrightarrow{K} . \left(\frac{\lambda_o}{B_o}\right) \nabla P_o + CG_o - \frac{q_o}{\rho_{osc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_o}{B_o}\right) = L_o$$

Water Phase Equation

$$\nabla . \overleftrightarrow{K} . \left(\frac{\lambda_w}{B_w}\right) \nabla P_o + CG_w - \frac{q_w}{\rho_{wsc}} = \frac{\partial}{\partial t}\left(\frac{\phi S_w}{B_w}\right) = L_w$$

$$CG_w = -\nabla . \overleftrightarrow{K} . \left(\frac{\lambda_w}{B_w}\right) \nabla \left(P_{cow} + \frac{\rho_w z}{144}\right)$$

Gas Phase Equation

$$\nabla.\overleftrightarrow{K}.\left(\frac{\lambda_g}{B_g}+R_{so}\frac{\lambda_o}{B_o}+R_{sw}\frac{\lambda_w}{B_w}\right)+CG_g-\frac{q_g}{\rho_{gsc}}=$$

$$\frac{\partial}{\partial t}\left[\phi\left(\frac{S_g}{B_g}+R_{so}\frac{S_o}{B_o}+R_{sw}\frac{S_w}{B_w}\right)\right]=L_g$$

$$CG_g=\nabla.\overleftrightarrow{K}.\ \frac{\lambda_g}{B_g}\nabla\left(P_{cgo}-\frac{\rho_g z}{144}\right)-R_{so}\frac{\lambda_o}{B_o}\nabla\left(\frac{\rho_o z}{144}\right)$$

$$-R_{sw}\frac{\lambda_w}{B_w}\nabla\left(P_{cow}-\frac{\rho_w z}{144}\right)$$

Coupling Above 3-Phase Equations

$$\left(B_o-R_{so}B_g\right)L_o+\left(B_w-R_{sw}B_g\right)L_w+B_gL_g$$

$$=\ \phi c_t\frac{\partial P_o}{\partial t}$$

$$c_t=c_r+c_oS_o+c_wS_w+c_gS_g$$

$$S_o+S_w+S_g=1$$

Solve Pressure Equation

Implicitly

$$(B_o - R_{so}B_g)\left[\nabla.\overleftrightarrow{K}.\left(\frac{\lambda_o}{B_o}\right)\nabla P_o + CG_o - \frac{q_o}{\rho_{osc}}\right] +$$

$$(B_w - R_{sw}B_g)\left[\nabla.\overleftrightarrow{K}.\left(\frac{\lambda_w}{B_w}\right)\nabla P_o + CG_w - \frac{q_w}{\rho_{wsc}}\right] +$$

$$B_g\left[\nabla.\overleftrightarrow{K}.\left(\frac{\lambda_g}{B_g} + R_{so}\frac{\lambda_o}{B_o} + R_{sw}\frac{\lambda_w}{B_w}\right)\nabla P_o + CG_g - \frac{q_g}{\rho_{gsc}}\right] = \phi c_t \frac{\partial P_o}{\partial t}$$

Solve Explicitly for

Saturations

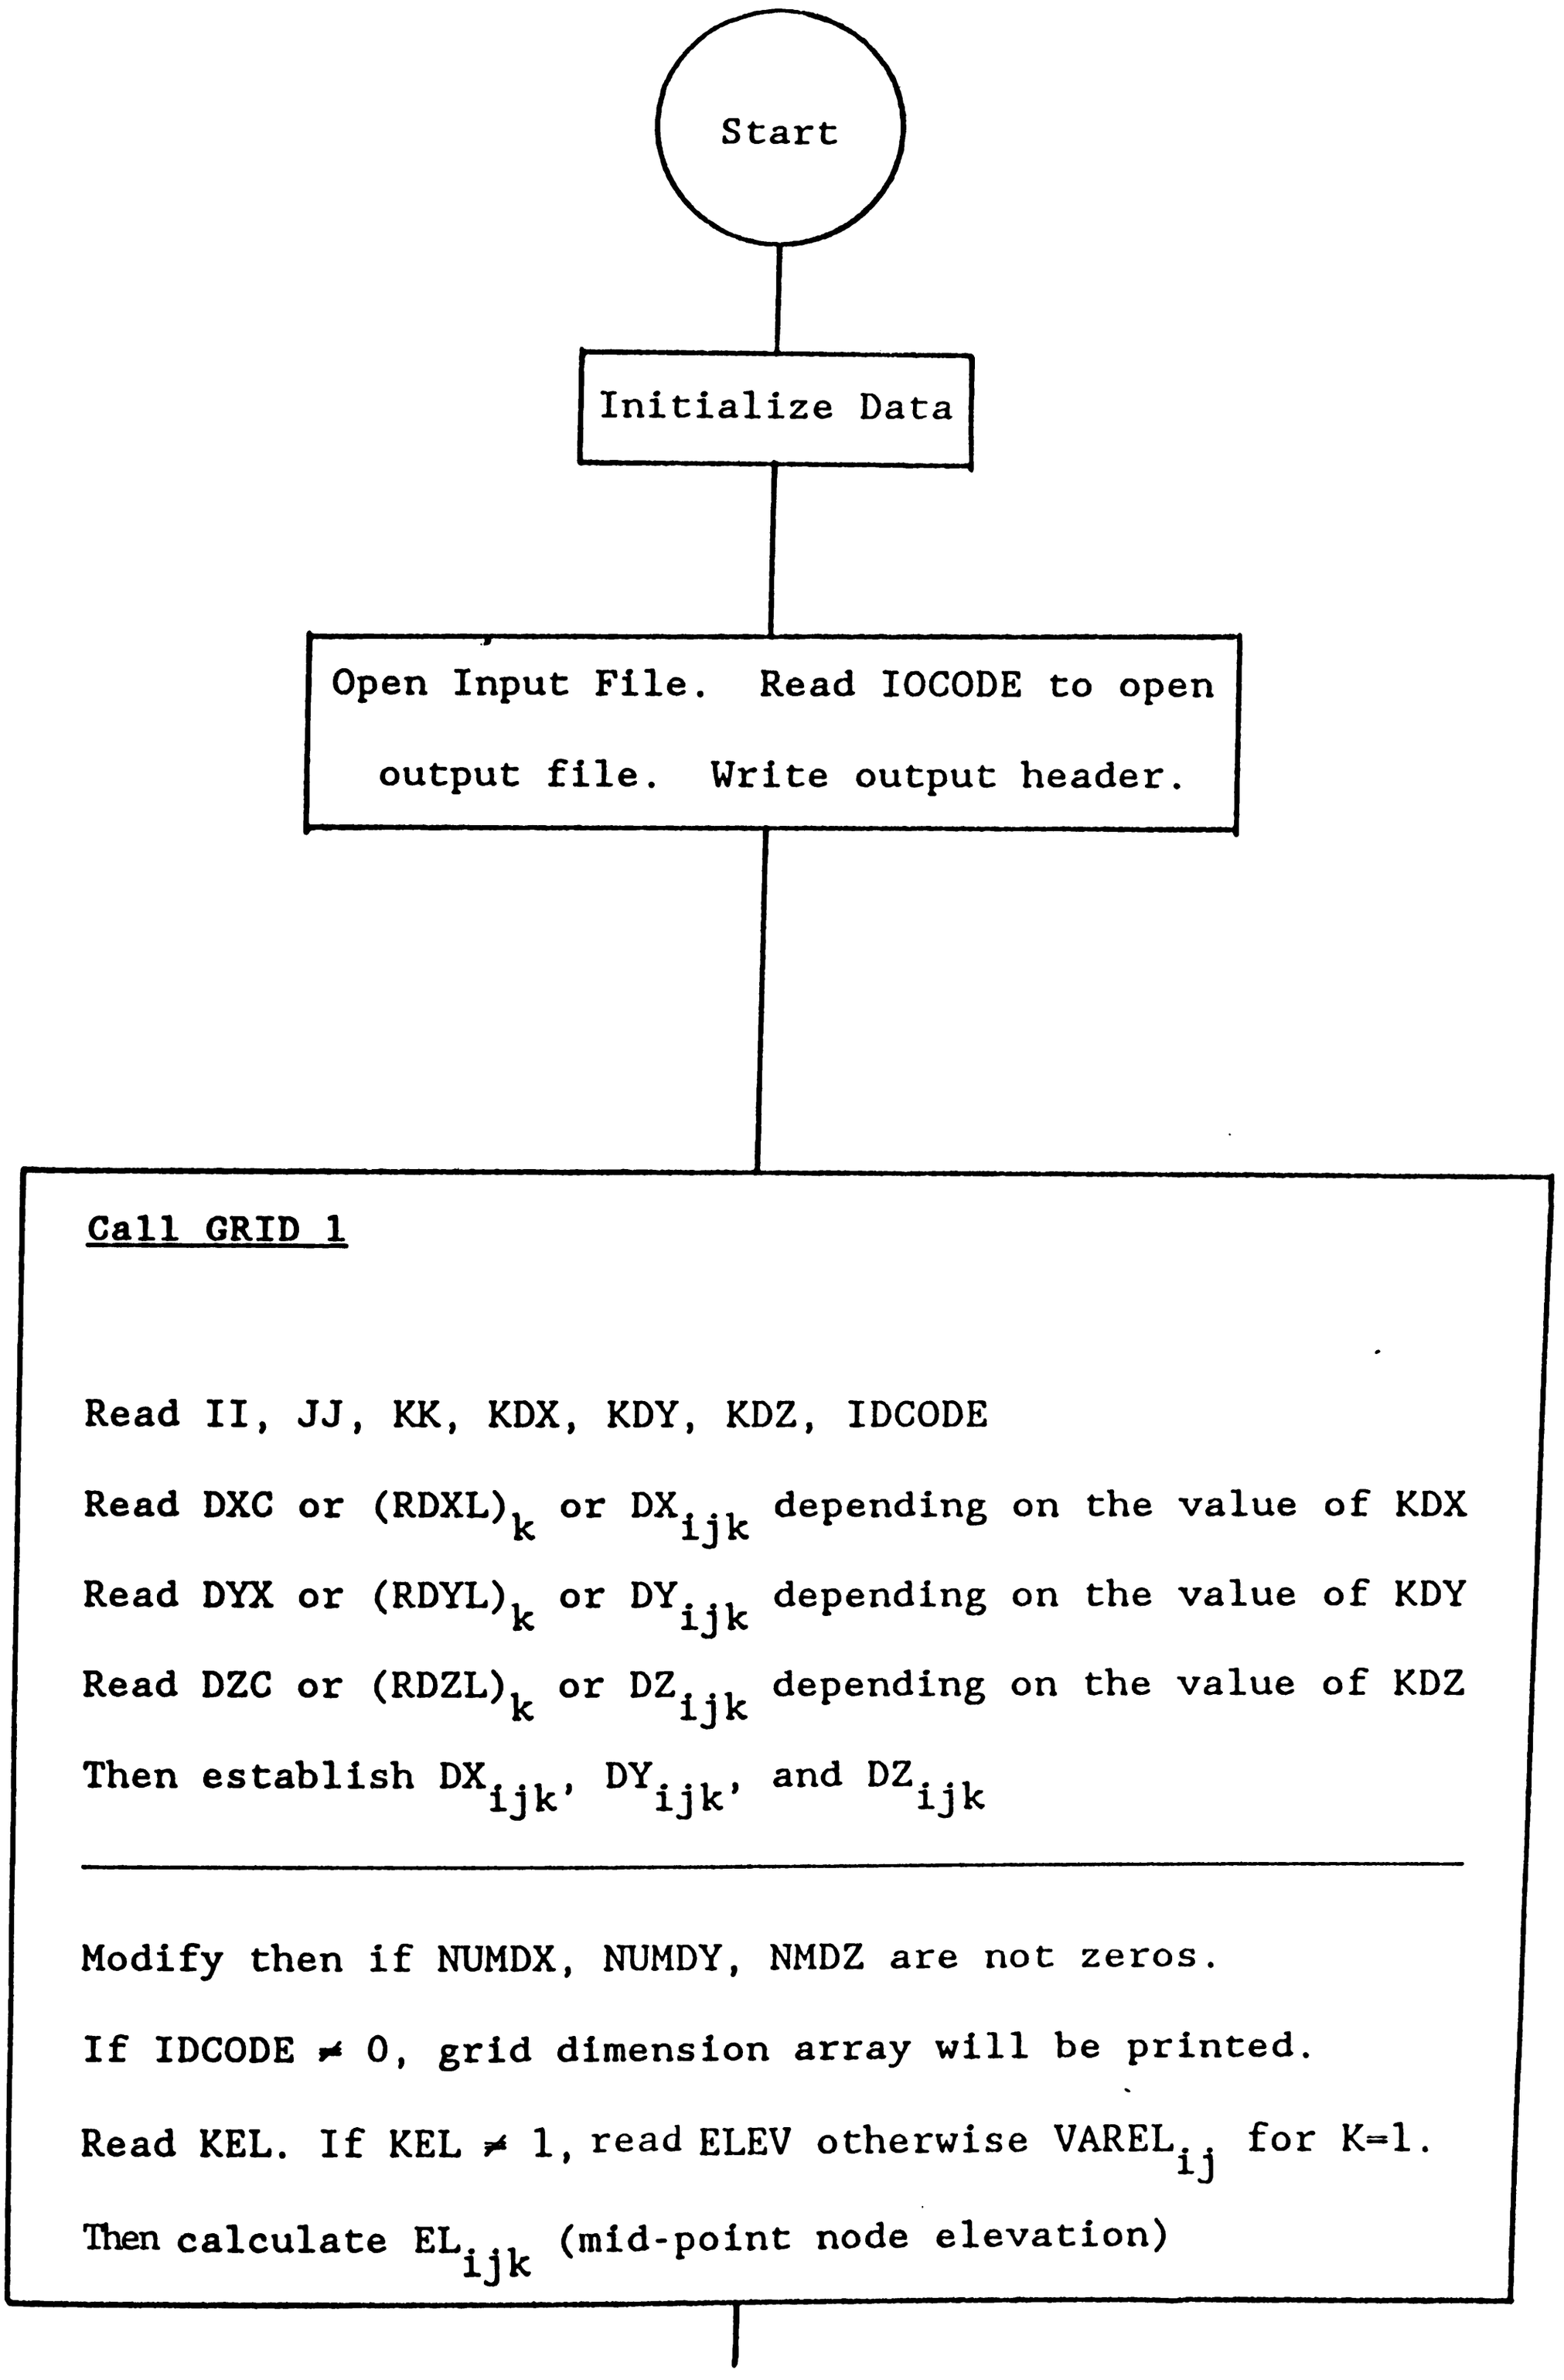
$$\frac{1}{\Delta t}\left[\left(\frac{\phi S_o}{B_o}\right)^{n+1} - \left(\frac{\phi S_o}{B_o}\right)^{n}\right] =$$

$$\nabla.\overleftrightarrow{K}.\left(\frac{\lambda_o}{B_o}\right)\nabla\left(P_o - \frac{\rho_o z}{144}\right) - \frac{q_o}{\rho_{osc}}$$

Similarly, calculate $(S_w)^{n+1}$ Then

$$(S_g)^{n+1} = 1 - (S_o + S_w)^{n+1}$$

5.3 Flow Chart for GWSIM Simulator



Call PARM1

Read KPH, KKX, KKY, KKZ, NUMP, NUMKX, NUMKY, NUMKZ, IPCODE

Read PHIC or $(RPHL)_k$ or VP_{ijk} depending on the value of KPH

Read KXC or $(RKXL)_k$ or KX_{ijk} depending on the vlaue of KKX

Read KYC or $(RKYL)_k$ or KY_{ijk} depending on the value of KKY

Read KZC or $(RKZL)_k$ or KZ_{ijk} depending on the value of KKZ

Then establish VP_{ijk}, KX_{ijk}, KY_{ijk} and KZ_{ijk}

Modify them if NUMP, NUMKX, NUMKY, NUMKZ are not zeros.

If IPCODE ≠ 0, modified porosity and permeability distributions will be printed.

Call TRAN1

Calculate TX_{ijk}, TY_{ijk}, TZ_{ijk}

$$TX_{ijk} = \frac{0.012656 * Al_{ijk} * Al_{i-1,jk}}{DX_{ijk} * Al_{i-1,jk} + DX_{i-1,jk} * Al_{ijk}}$$

$$Al_{ijk} = KX_{ijk} * DY_{ijk} * DZ_{ijk}$$

Similarly TY_{ijk}, TZ_{ijk} are calculated.

Modify TX, TY, TZ if NUMTX, NUMTY, NUMTZ are not zeros.

If ITCODE ≠ 0, modified transmissibility distribution is printed.

Call TABLE

READ SAT_i, $KRWT_i$. $KRGT_i$, $PCGWT_i$ for I = 1, NTE

Note: SAT(1) = −0.1 and SAT(N) = 1.1

Read PMAXT, PWT_i, $MUWT_i$, BWT_i, $RSWT_i$ for i = 1, NTE

Note: PWT (Last entry) = PMAXT

Read PGT_i, $MUGT_i$, BGT_i, CRT_i for i = 1, NTE

Note: PGT (Last entry) = PMAXT

Read RHOSCW, RHOSW

Calculate $BWPT_i = (\partial B_w/\partial p)_i$, $RWSPT_i = (\partial R_{sw}/\partial p)_i$, $BGPT_i = (\partial B_g/\partial p)_i$

Call UINIT 1

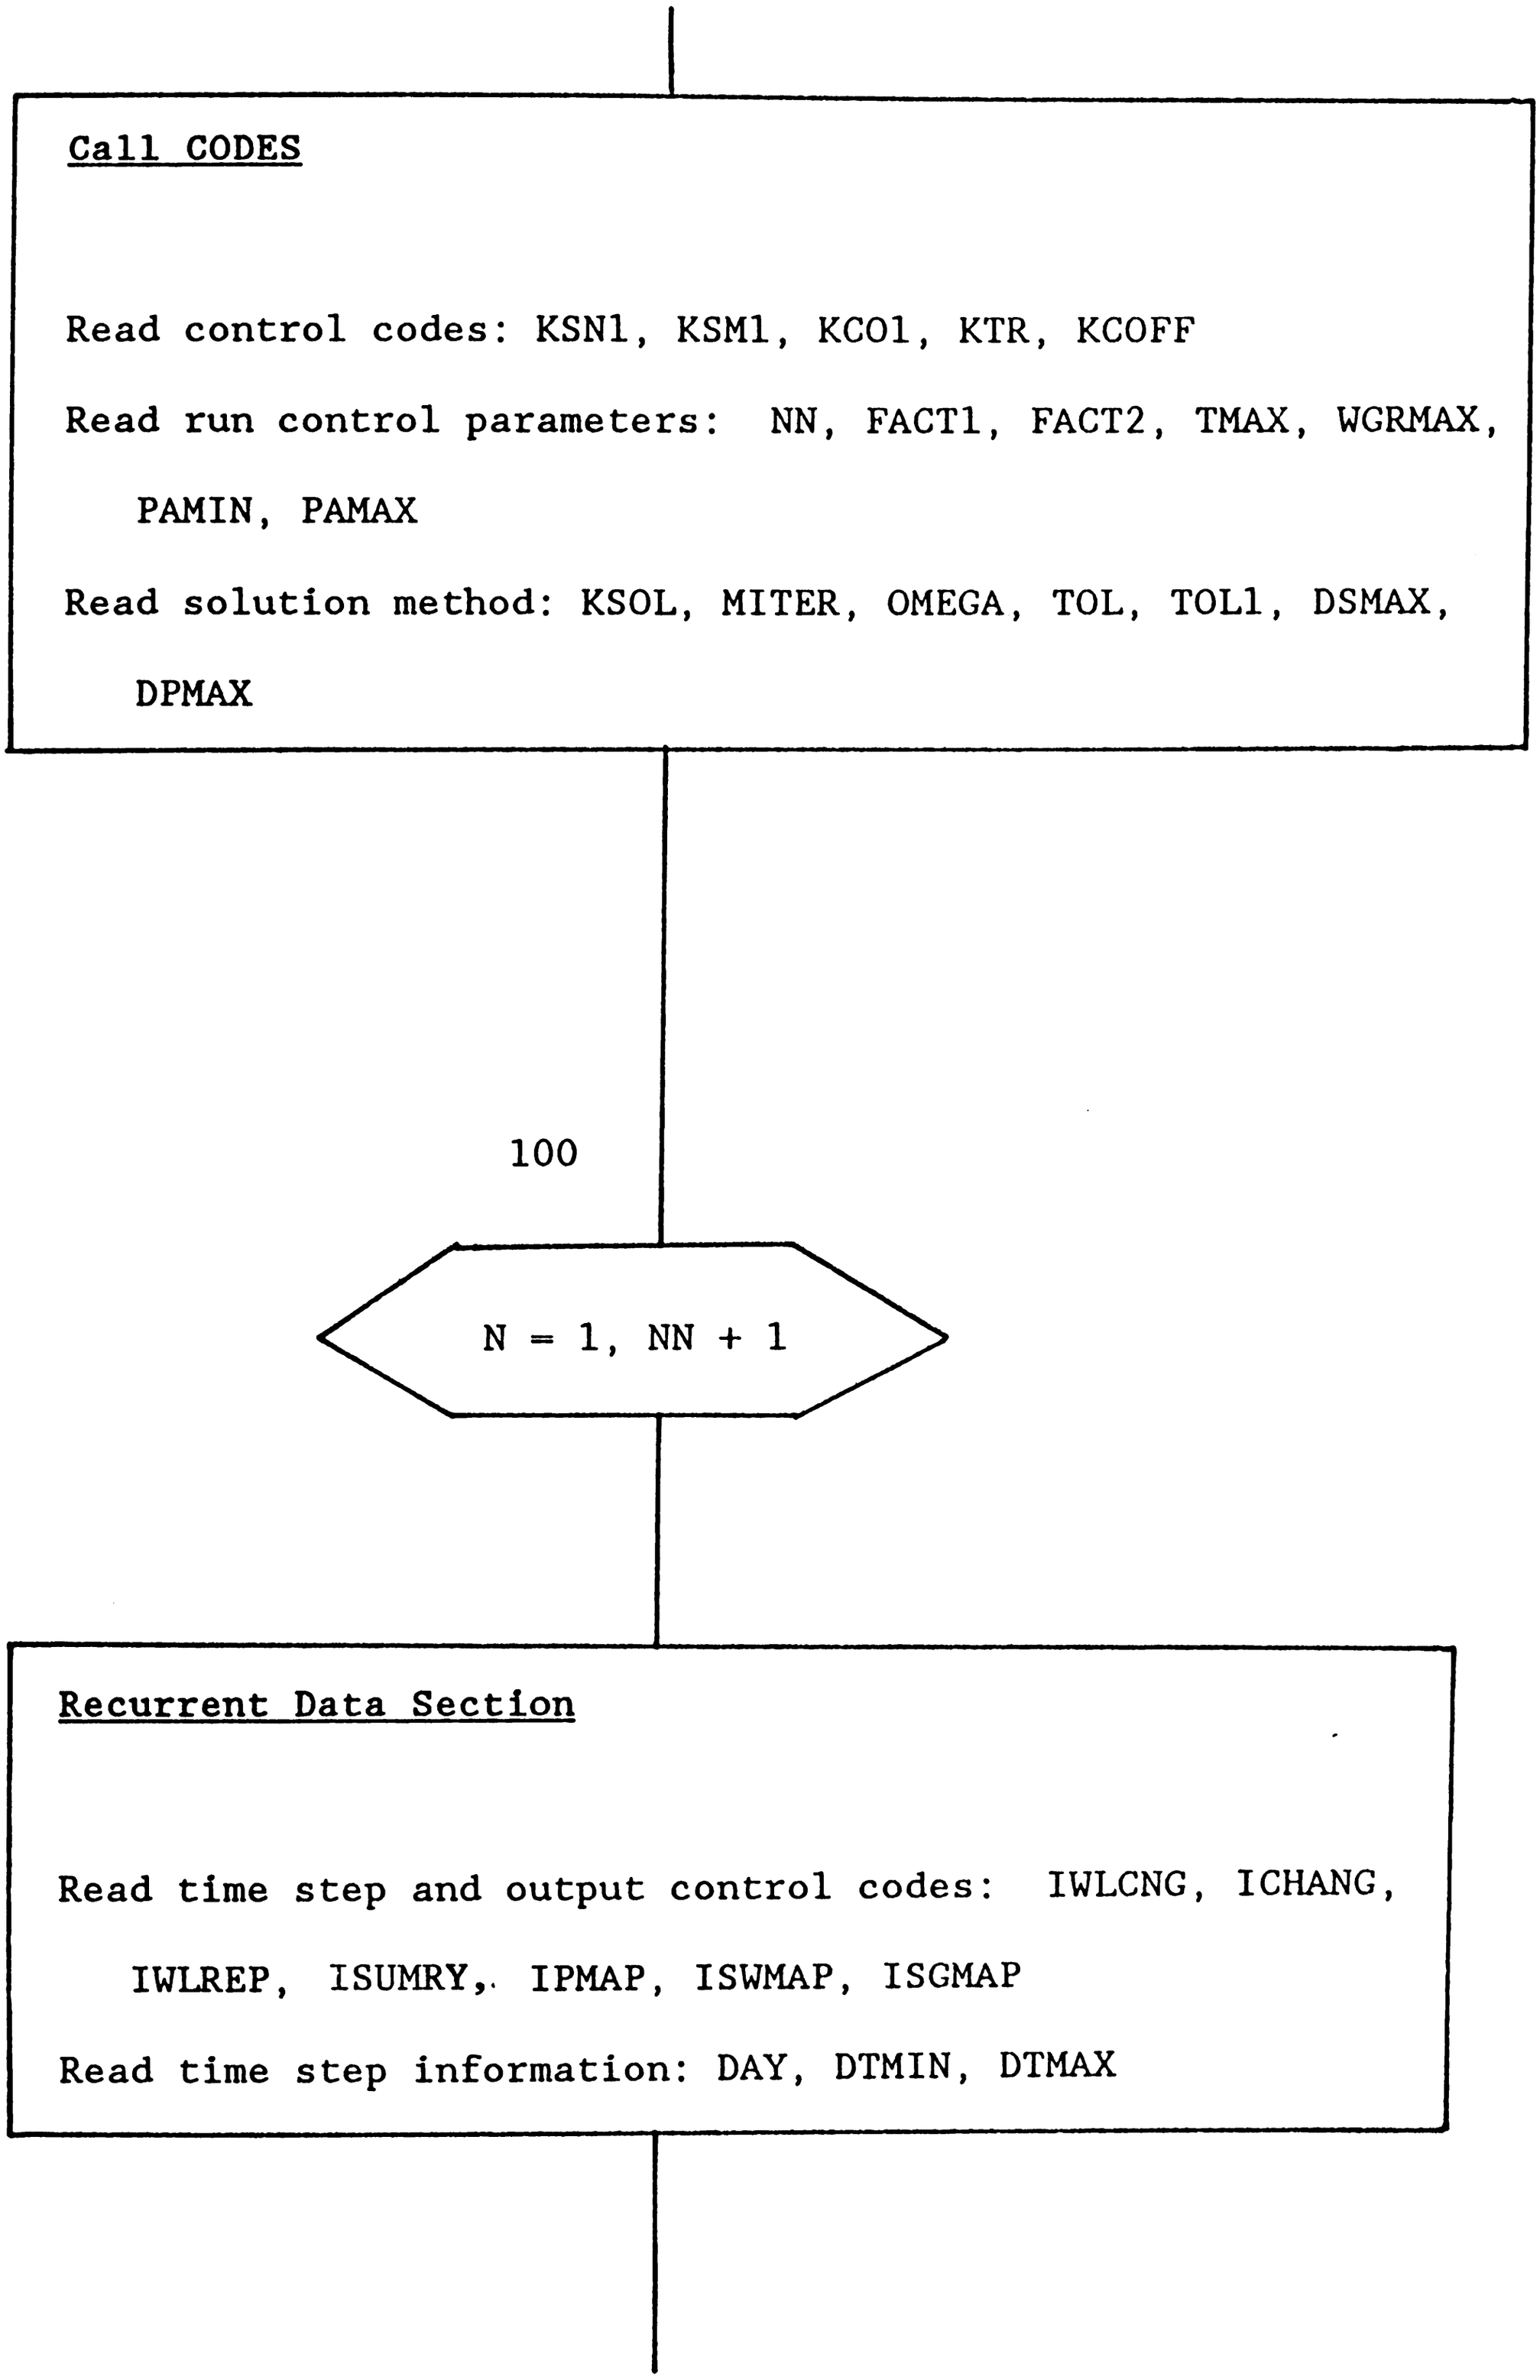
Read KPI, KSI

Read PGWC, GWC if KPI = 0, and calulate PN_{ijk}.

If KPI = 1, read PN_{ijk}.

Read SWC if KSI = 0, and establish SW_{ijk} and SG_{ijk}.

If KSI = 1, read SW_{ijk} and calculate SG_{ijk} (ie $1 - SW_{ijk}$).



Call CODES
Read control codes: KSN1, KSM1, KCO1, KTR, KCOFF
Read run control parameters: NN, FACT1, FACT2, TMAX, WGRMAX,
PAMIN, PAMAX
Read solution method: KSOL, MITER, OMEGA, TOL, TOL1, DSMAX,
DPMAX
100
N = 1, NN + 1
Recurrent Data Section
Read time step and output control codes: IWLCNG, ICHANG,
IWLREP, ISUMRY, IPMAP, ISWMAP, ISGMAP
Read time step information: DAY, DTMIN, DTMAX

Call NODES

Read $WELLID_j$, $IQN1_j$, $IQN2_j$, $IQN3_j$, $LAYER_j$, KIP_j, QNW_j, QVG_j,

QVT_j for j = 1, NVQN

Read $(WRAD)_k$, $(SKIN)_k$, PWF_{jk} Note: If $(SKIN)_k \geq 500$, $PID_{jk} = 0$

Then calculate PID_{jk} for j = 1, NVQN, and k = $IQN3_j$, LAY where

$LAY = IQN3_j + LAYER_j - 1$

Calculate:

(i) $Resvol = \Sigma\ V_{ijk} * DX_{ijk} * DY_{ijk} * DZ_{ijk}$

(ii) CW and CG; then $CT = CR + CW * SW_{ijk} + CG * SG_{ijk}$

(iii) $(OWIP)_k$, $(ODGIP)_k$, $(OFGIP)_k$

(iv) $TOWIP = \sum_{k=1}^{kk} (OWIP)_k$, $TODGIP = \sum_{k=1}^{kk} (ODGIP)_k$

$TOGFIP = \sum_{k=1}^{kk} (OFGIP)_k$

Call PRTPS

Print summary report.

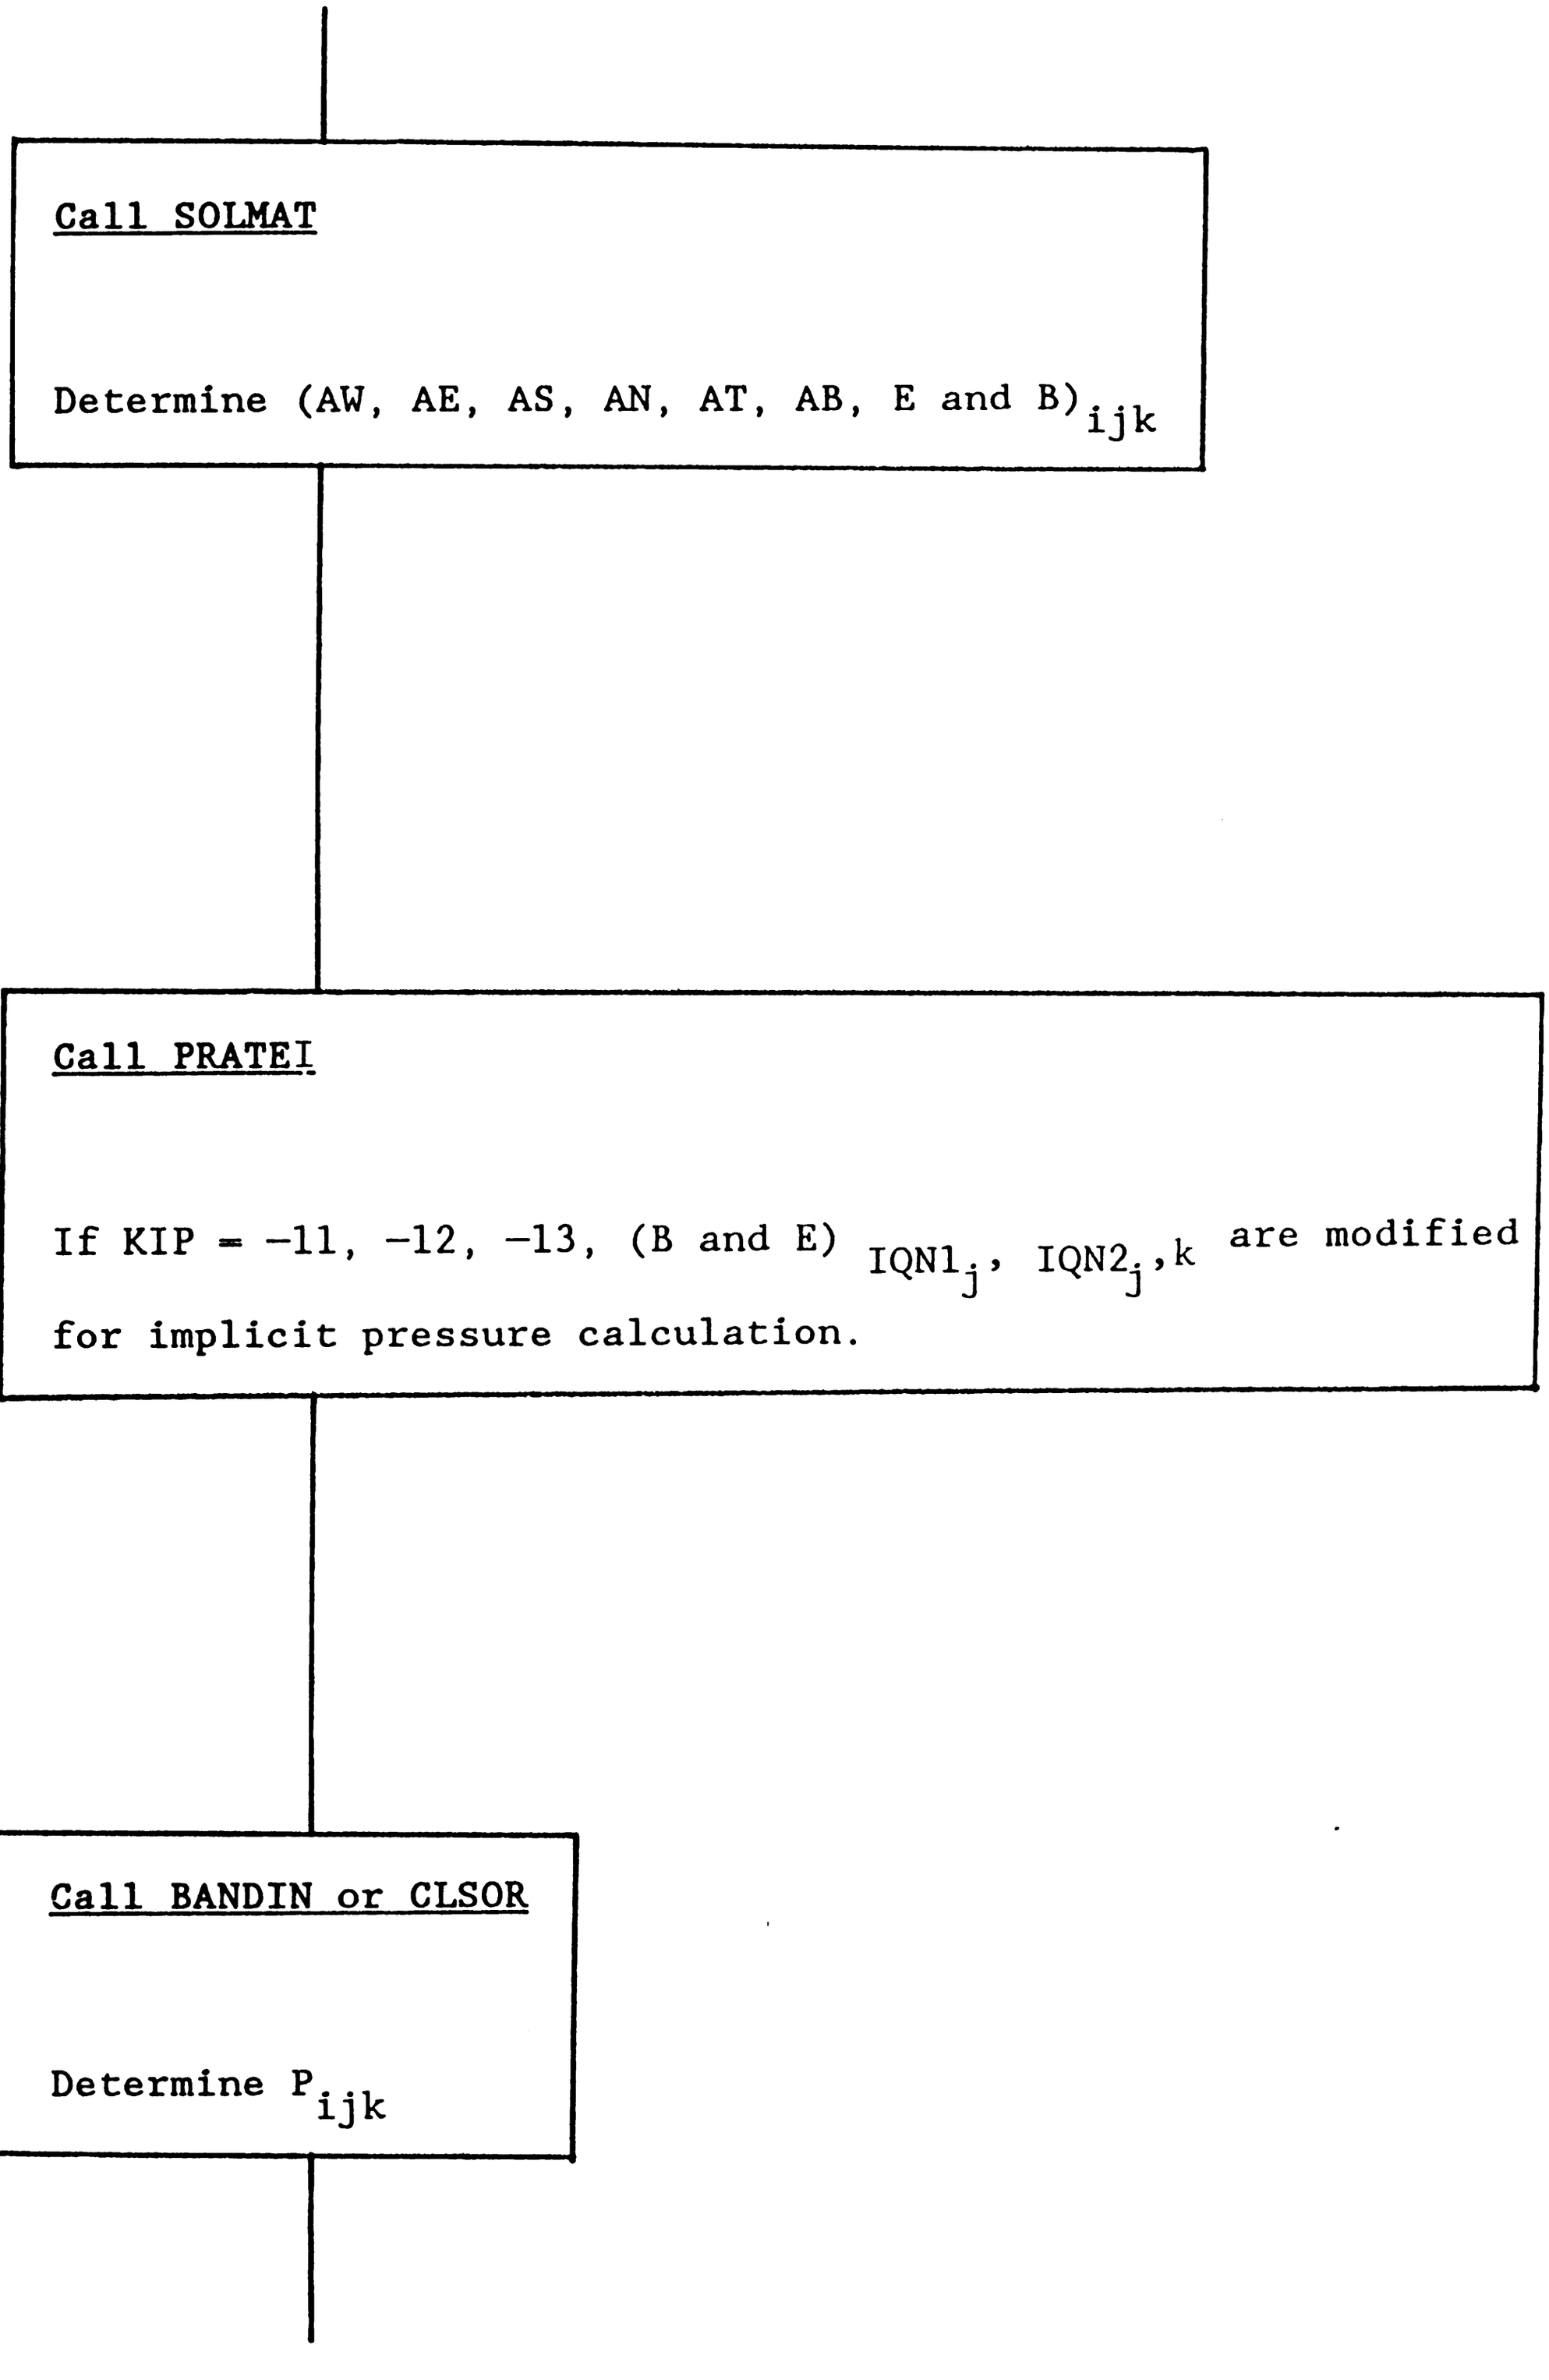
Print pressure and saturation distribution maps if IPMAP, ISWMAP and ISGMAP are not zeros.

Call QRATE

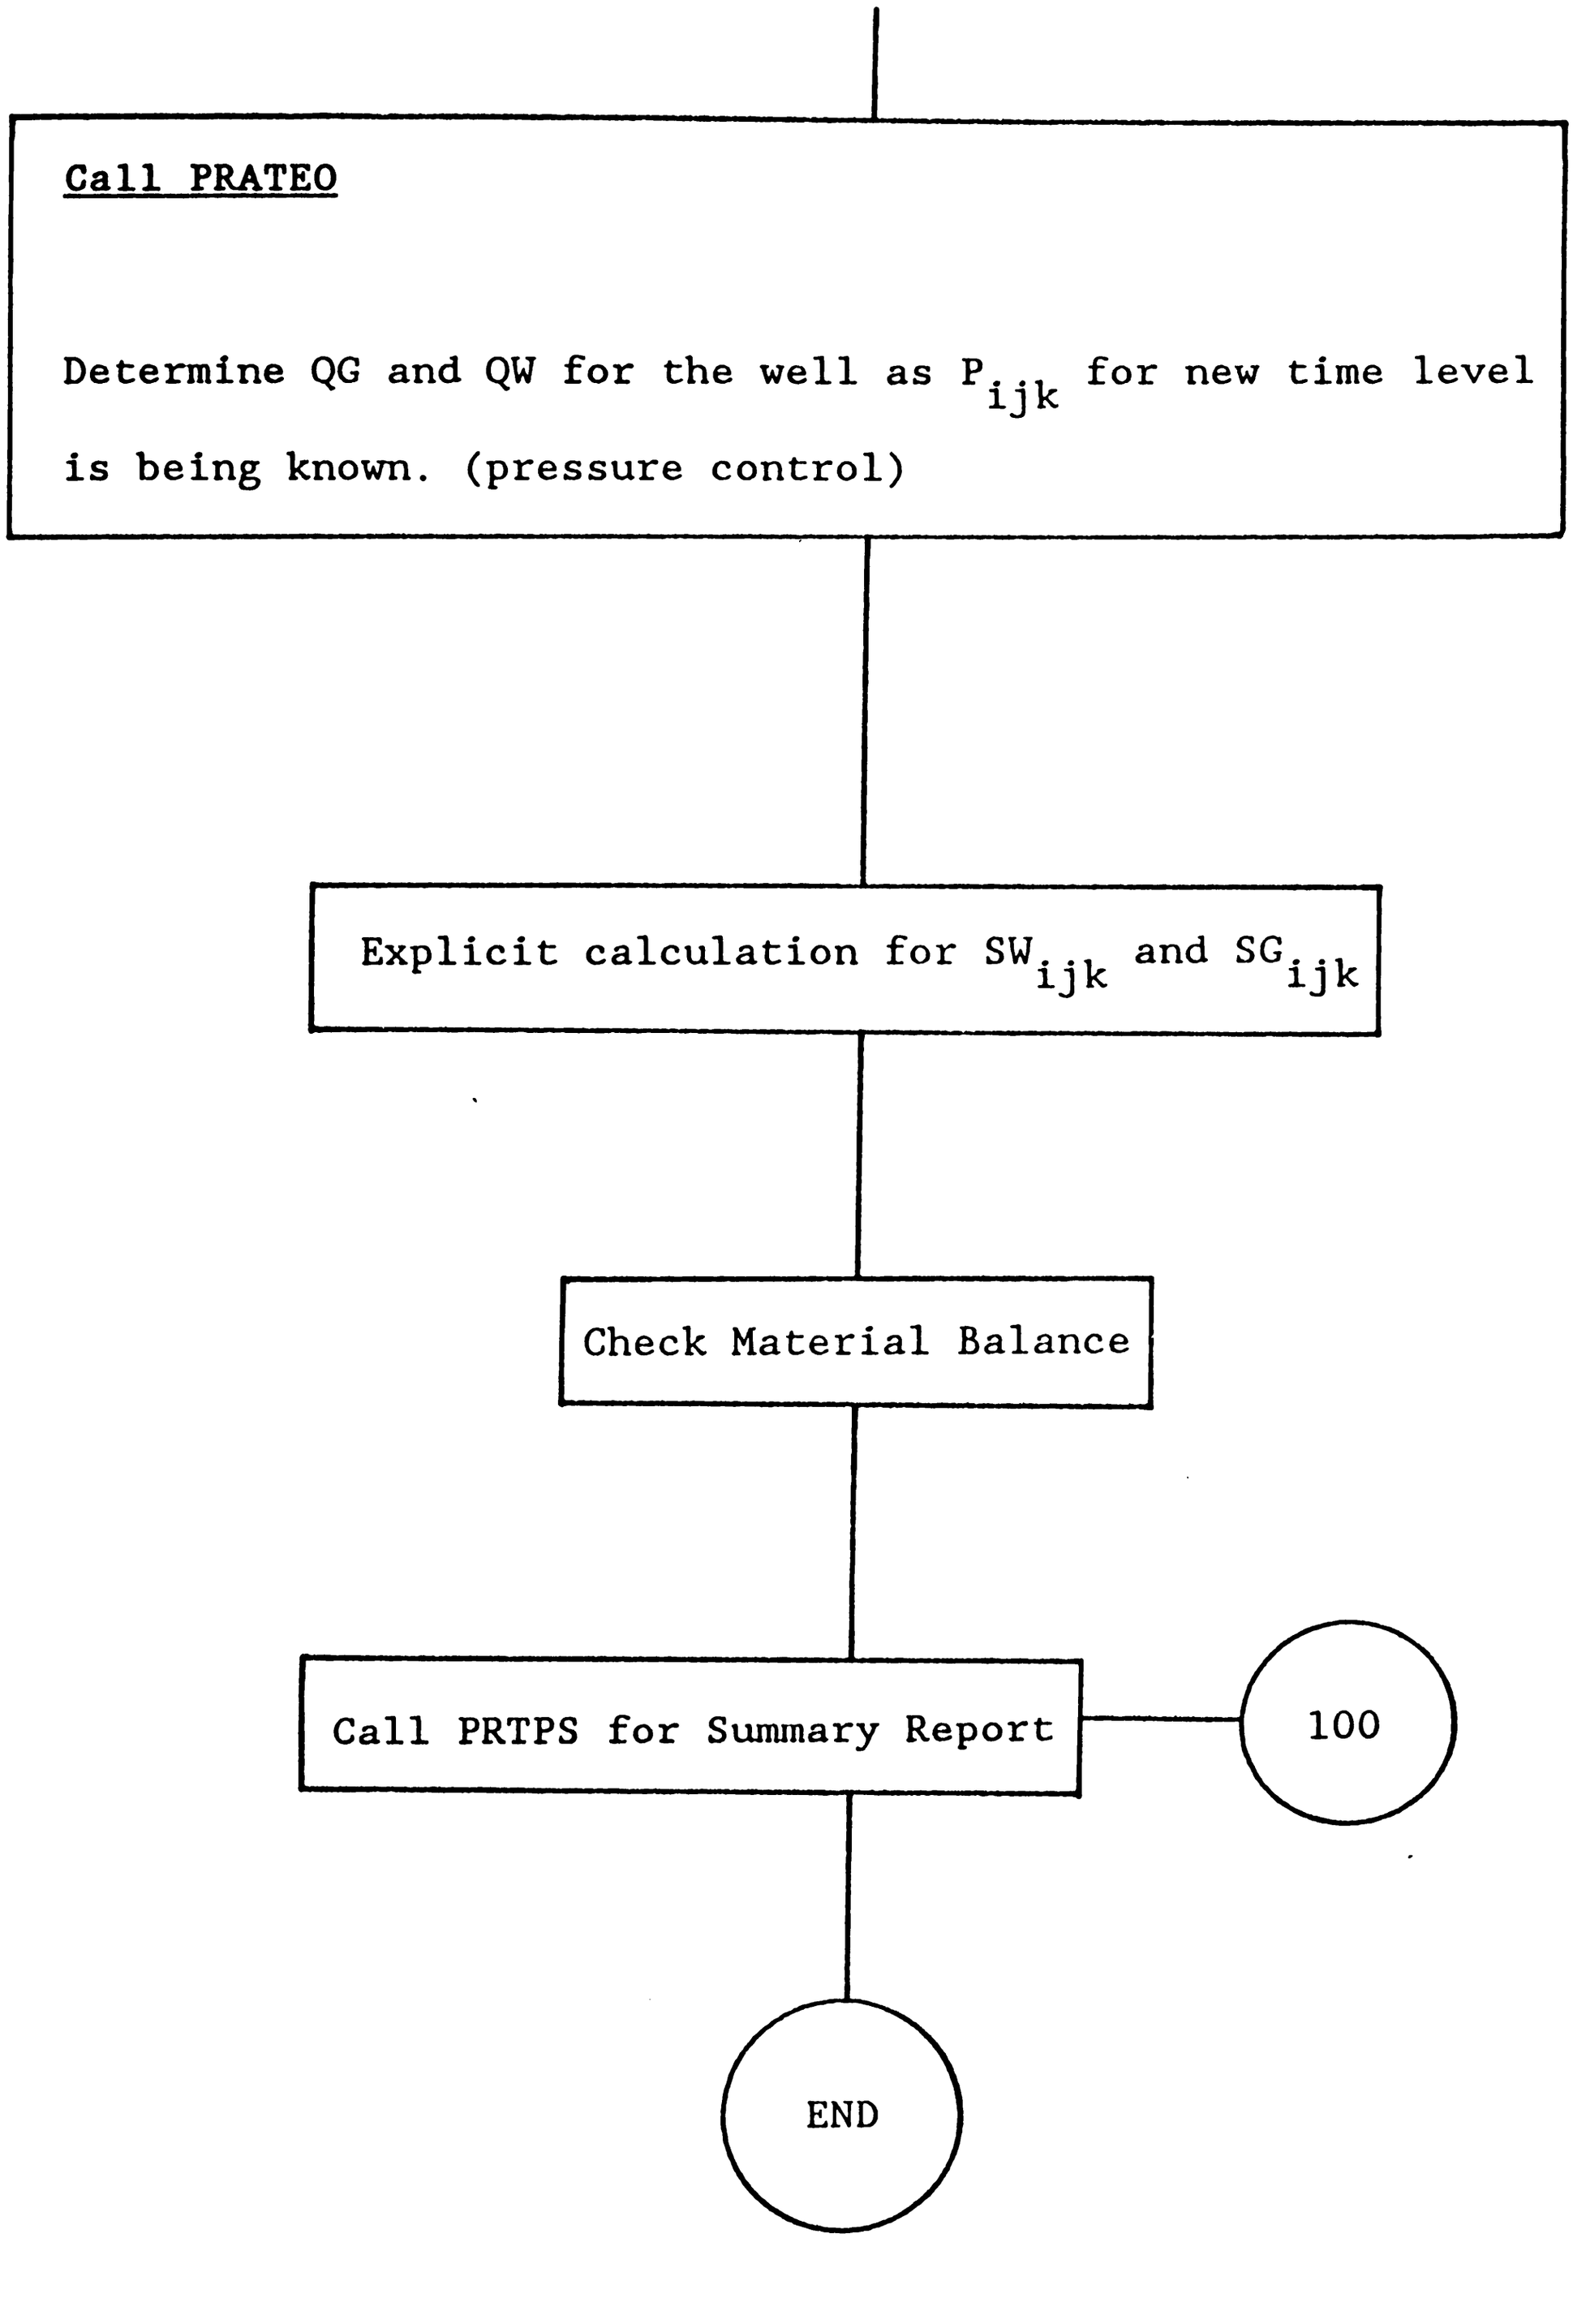
Calculate first GMG_{jk}, and GMW_{jk} for j = 1, NVQN and k = IQN3, LAY.

If KIP = 1, 2, 3 (rate constraint), calculate $(QW, QG)_{IQN1_j, IQN2_j, k}$ and then calculate PWFC.

If KIP = −1, −2, −3 (PI and pressure control - explicit pressure calculation), calculate $(QW, QG)_{IQN1_j, IQN2_j, k}$



Call SOLMAT
Determine (AW, AE, AS, AN, AT, AB, E and B)ijk
Call PRATEI
If KIP = −11, −12, −13, (B and E) IQN1j, IQN2j,k are modified for implicit pressure calculation.
Call BANDIN or CLSOR
Determine Pijk



Call PRATEO
Determine QG and QW for the well as P_{ijk} for new time level is being known. (pressure control)
Explicit calculation for SW_{ijk} and SG_{ijk}
Check Material Balance
Call PRTPS for Summary Report
100
END

5.4 Codes for Type of Input to be Used

The following codes concerning data input conventions apply to all of the input data.

Grid Dimensions and Geometry

Kdx, Kdy, Kdz: codes for controlling input of x, y and z-direction grid dimensions respectively.

Code	Meaning
Kdx = −1	The x-direction grid dimensions are the same for all blocks in the grid. Only one value (Dxc) must be read.
Kdx = 0	The x-direction dimensions are read for each grid block in the first row of layer one (K=1). These same x-direction dimensions are assigned to all other rows and all other layers in the model grid. II values of Rdxl must be read.
Kdx = +1	The x-direction dimensions are read for every grid block in layer one. These same x-direction dimensions are assigned to all other layers in the model grid. II*JJ values of $Dx_{ij'1}$ must be read.
Kdy = −1	The y-direction grid dimensions are the same for all blocks in the grid. Only one value of Dyc must be read.
Kdy = 0	The y-direction dimenions are read for each grid block in the first column of layer one. These same y-direction

dimensions are assigned to all other columns and all other layers in the model grid. JJ values of Rdyl must be read.

Kdy = +1 The y-direction dimenions are read for every grid block in layer one. These same y-direction dimensions are assigned to all other layers in the model grid. II*JJ values of $Dy_{ij'1}$ must be read.

Kdz = −1 The z-direction grid dimensions (block thicknesses) are the same for all blocks in the grid. Only one value of Dzc must be read.

Kdz = 0 A constant value of thickness (Rdzl) is read for each layer in the grid. KK values of Rdzl must be read.

Kdz = +1 The z-direction grid dimensions (block thicknesses) are read for every block in the model grid. II*JJ*KK values of Dz_{ijk} must be read.

Idcode : print code

Idcode = 0 means 'do not print the modified grid dimensions'

Idcode = 1 means 'print the modified grid dimensions'

Kel : input code for depth value

Kel = 0 means 'a single constant value of Elev is read for the depth to the top of all grid blocks in layer one.'

Kel = 1 means 'a separate depth value must be read for each grid block in layer one. II*JJ value of $Varel_{ij}$ must be read'.

Porosity and Permeability Distributions

Kph — code for controlling porosity data input

Kkx, KKy, Kkz — codes for controlling the x, y and z-direction permeability data input respectively.

Code	Meaning
- 1	A single constant value is read and assigned to all blocks in the model grid. Only one value is read.
0	A constant value is read for each of the KK layers in the grid. Individual layers may have a different, but constant, value. KK values must be read.
+ 1	A separate value is read for each block in the grid. II*JJ*KK values must be read.

Ipcode — print code

Ipcode = 0 means 'do not print modified porosity and permeability distributions'

Ipcode = 1 means 'print modified porosity and permeability distributions'

Itcode — print code

Itcode = 0 means 'do not print the modified transmissibility distributions'

Itcode = 1 means 'print the modified transimissibility distributions'

Pressure and Saturation Initialization

There are two options for pressure and saturation initialization.

The initial pressure distribution can be calculated by the program for equilibrium conditions given the location of the gas/oil contact and oil/water contact (for GOWSIM) and the gas/water contact (for GWSIM) and the pressure at contact.

The initial pressure distribution can be read on a block-by-block basis.

Saturations can either be read as constant values over the entire grid or the entire saturation distributions are read on a block-by-block basis.

Kpi,Ksi pressure and saturation initialization codes respectively

Code	Meaning
Kpi = 0	Use equilibrium pressure initialization. Input required will be pressures at the oil/water contact and gas/oil contact (for GOWSIM) and pressure at the gas/water contact (for GWSIM) and depths to each contact.
Kpi = 1	Use non-equilibrium pressure initialization. Pressures for each block must be read on a block-by-block basis. II*JJ*JJ values of pressure must be read.
Ksi = 0	Initial phase saturations are constant over the entire model grid.
Ksi = 1	Phase saturations must be read for each grid block on a block-by-block basis. That is, 2*II*JJ*KK values of saturations must be read for GOWSIM and II*JJ*KK vlaues of saturation for GWSIM.

Debug and Diagnostics Codes

Ksnl	CLSOR parameter debug output control code
Ksml	solution matrix debug output control code
Kcol	compressibility and formation volume factor debut output control code
Ktr	transmissibility debug output control code
Kcoff	density and saturation debug output control code

The zero values of above codes mean 'do not print diagnostics output'

The 1's for above codes mean 'print diagnostics output'.

Solution Method Specifications

Ksol — solution method code

Ksol = 1 means 'direct solution - BAND algorithm'

Ksol = 2 means 'CLSOR - iterative line successive overrelaxation with additive corrections method'

Time Step and Output Control

Iwlcng — code to tell program whether or not the well information cards should be read this time step.
Iwlcng = 1 means 'read well information this time step'
Iwlcng = 0 means 'do not read well information this time step'

Iwlrep — output code to control printing of the well report

Isumry — output code to control printing of the time step summary report

Ipmap — output code to control printing of the map of grid block pressures

Isomap — output code to control printing of the grid block oil saturations

Iswmap — output code to control printing of the grid block water saturations

Isgmap — output code to control printing of the grid block gas saturations

Ipbmap — output code to control printing of the grid block saturation pressures

Code	Meaning
Kip = 1	Production (oil) well - rate specified
Kip = 2	Water well - rate specified
Kip = 3	Gas well - rate specified
Kip = −1	Production (oil) well - PI and FBHP control (explicit pressure calculation)
Kip = −2	Water well - PI and FBHP control (explicit pressure calculation)
Kip = −3	Gas well - PI and FBHP control (explicit pressure calculation)
Kip = −11	Production (oil) well - PI and FBHP control (implicit pressure calculation)
Kip = −12	Water well - PI and FBHP control (implicit pressure calculation)
Kip = −13	Gas well - PI and FBHP control (implicit pressure calculation)

Gas wells (Kip = 3, −3, −13) will produce or inject single phase gas only.

Water wells (Kip = 2, −2, −12) will produce or inject single phase water only.

Oil wells (Kip = 1, −1, −11) will produce three phases in proportions determined by reservoir conditions and well constraints. Negative rates indicate fluid injection while positive rates indicate fluid production.

There is an important comment on PI. Once a well has been completed in a certain layer, that layer must continue to be specified on all succeeding well information cards, even if the layer or the well is shut in. To shut in a well, set that layer skin equal to or greater than 500. To shut in a well, set all of its layer skin's equal to or greater than 500.

Value of Output Code	Meaning
0	Do not ptint the report/array
1	Print the report/array at every time step during this interval

Well Information

Kip — code for specifying both well type and whether the well's production (injection) performance is determined by specifying rates or by specifying flowing bottom-hole pressure and also whether an explicit or implicit pressure calculation is to be done.

CHAPTER 6: INPUT DATA FILES AND RESULTS

Introduction

This chapter provides a variety of problems which have been solved using the GOWSIM, GWSIM and WSIM simulators. These problems cover a range of different model grid configurations and reservoir conditions:

1. One-dimensional, linear Buckley-Leverett waterflood displacement model.
2. Two-dimensional, areal grid model showing primary depletion of an undersaturated reservoir.
3. Two-dimensional, x-z cross-sectional model showing waterflooding of a layered system with multizone completions.
4. Two-dimensional, x-z cross-sectional model showing production from oil patch and gas patch reservoirs, with fluid contact levels at different depths, underlained by aquifer.
5. Linear, three-dimensional, two-phase model showing a single gas well producing from gas-water reservoir.
6. Two-dimensional, cross-section model of gas-water reservoir with two different fluid contact levels.
7. Three-dimensional water reservoir model.

In most of these problems, the GOWSIM solution is compared with either an analytical solution (in the case of the Buckley-Leverett) or with the solution of one or more commerically available black oil simulators' result on the same problem. It is quite noticeable that the general behaviour of reservoir prformance prediction is similar for all of the simulators, and thus it can provide a reasonable forecast of the general performance to be expected from a reservoir under user-specified operating condtions and constraints. Results from a reservoir simulation study must be viewed as an approximation to the expected performance and not as an exact performance prediction. The application of GWSIM and WSIM simulators on some reservoir problems are presented also.

Problem 1: One-Dimensional, Linear Buckley-Leverett Waterflood Model

Among the very few analytical solutions available that can be used to check black oil simulators, one such solution is the Buckley-Leverett line-drive waterflood calculation. GOWSIM performs this calculation to provide a test of saturation results. The structure of problem 1 is illustrated in Fig. (6.1). Data for the Buckley-Leverett waterflood are presented as GOWSIM input data on free formatted coding form in Table (6.1).

The model is a one-dimensional, linear, homogeneous reservoir with an oil well at one end grid block producing 600 STBD (B_o = 1.5), which is balanced by water injection under rate constraint of 900 STBD (B_w = 1.0) into the opposite end grid block -

Frontal results from the GOWSIM calculation are shown in Table (6.2) after an elapsed time of 360 days. These results are plotted against the analytical solution in Fig.(6.2), which shows good agreement except at the piston-like displacement front. This dispersing of the saturation front is a phenomenom inherent in all finite difference simulators and is known as numerical dispersion. This effect can be reduced by adjusting the time step in simulator.

NOTE: (The data file name for GOWSIM is BOAST.DAT and the output file name is BOAST.RES and the common block file name is COMMB3.FOR. Before running the program, it is important to check if the input data match with the parameters in the common block file).

Problem 2: Two-Dimensional Areal Model Showing Primary Depletion of an Undersaturated Reservoir

In this problem, a single well is producing under a rate constraint of 300 BOPD from the centre of a two-dimensional areal reservoir model (II = 9, JJ = 9, KK = 1) with production coming from fluid expansion drive (Fig.6.3). The input data file for this problem is shown in Table (6.3).

The results for this problem illustrate primarily the simulator pressure solution because saturations do not change for the undersaturated reservoir (Table 6.4). These results are presented in Fig. 6.4 along with the solution to this same problem using the BOAST simulator with LSOR method.

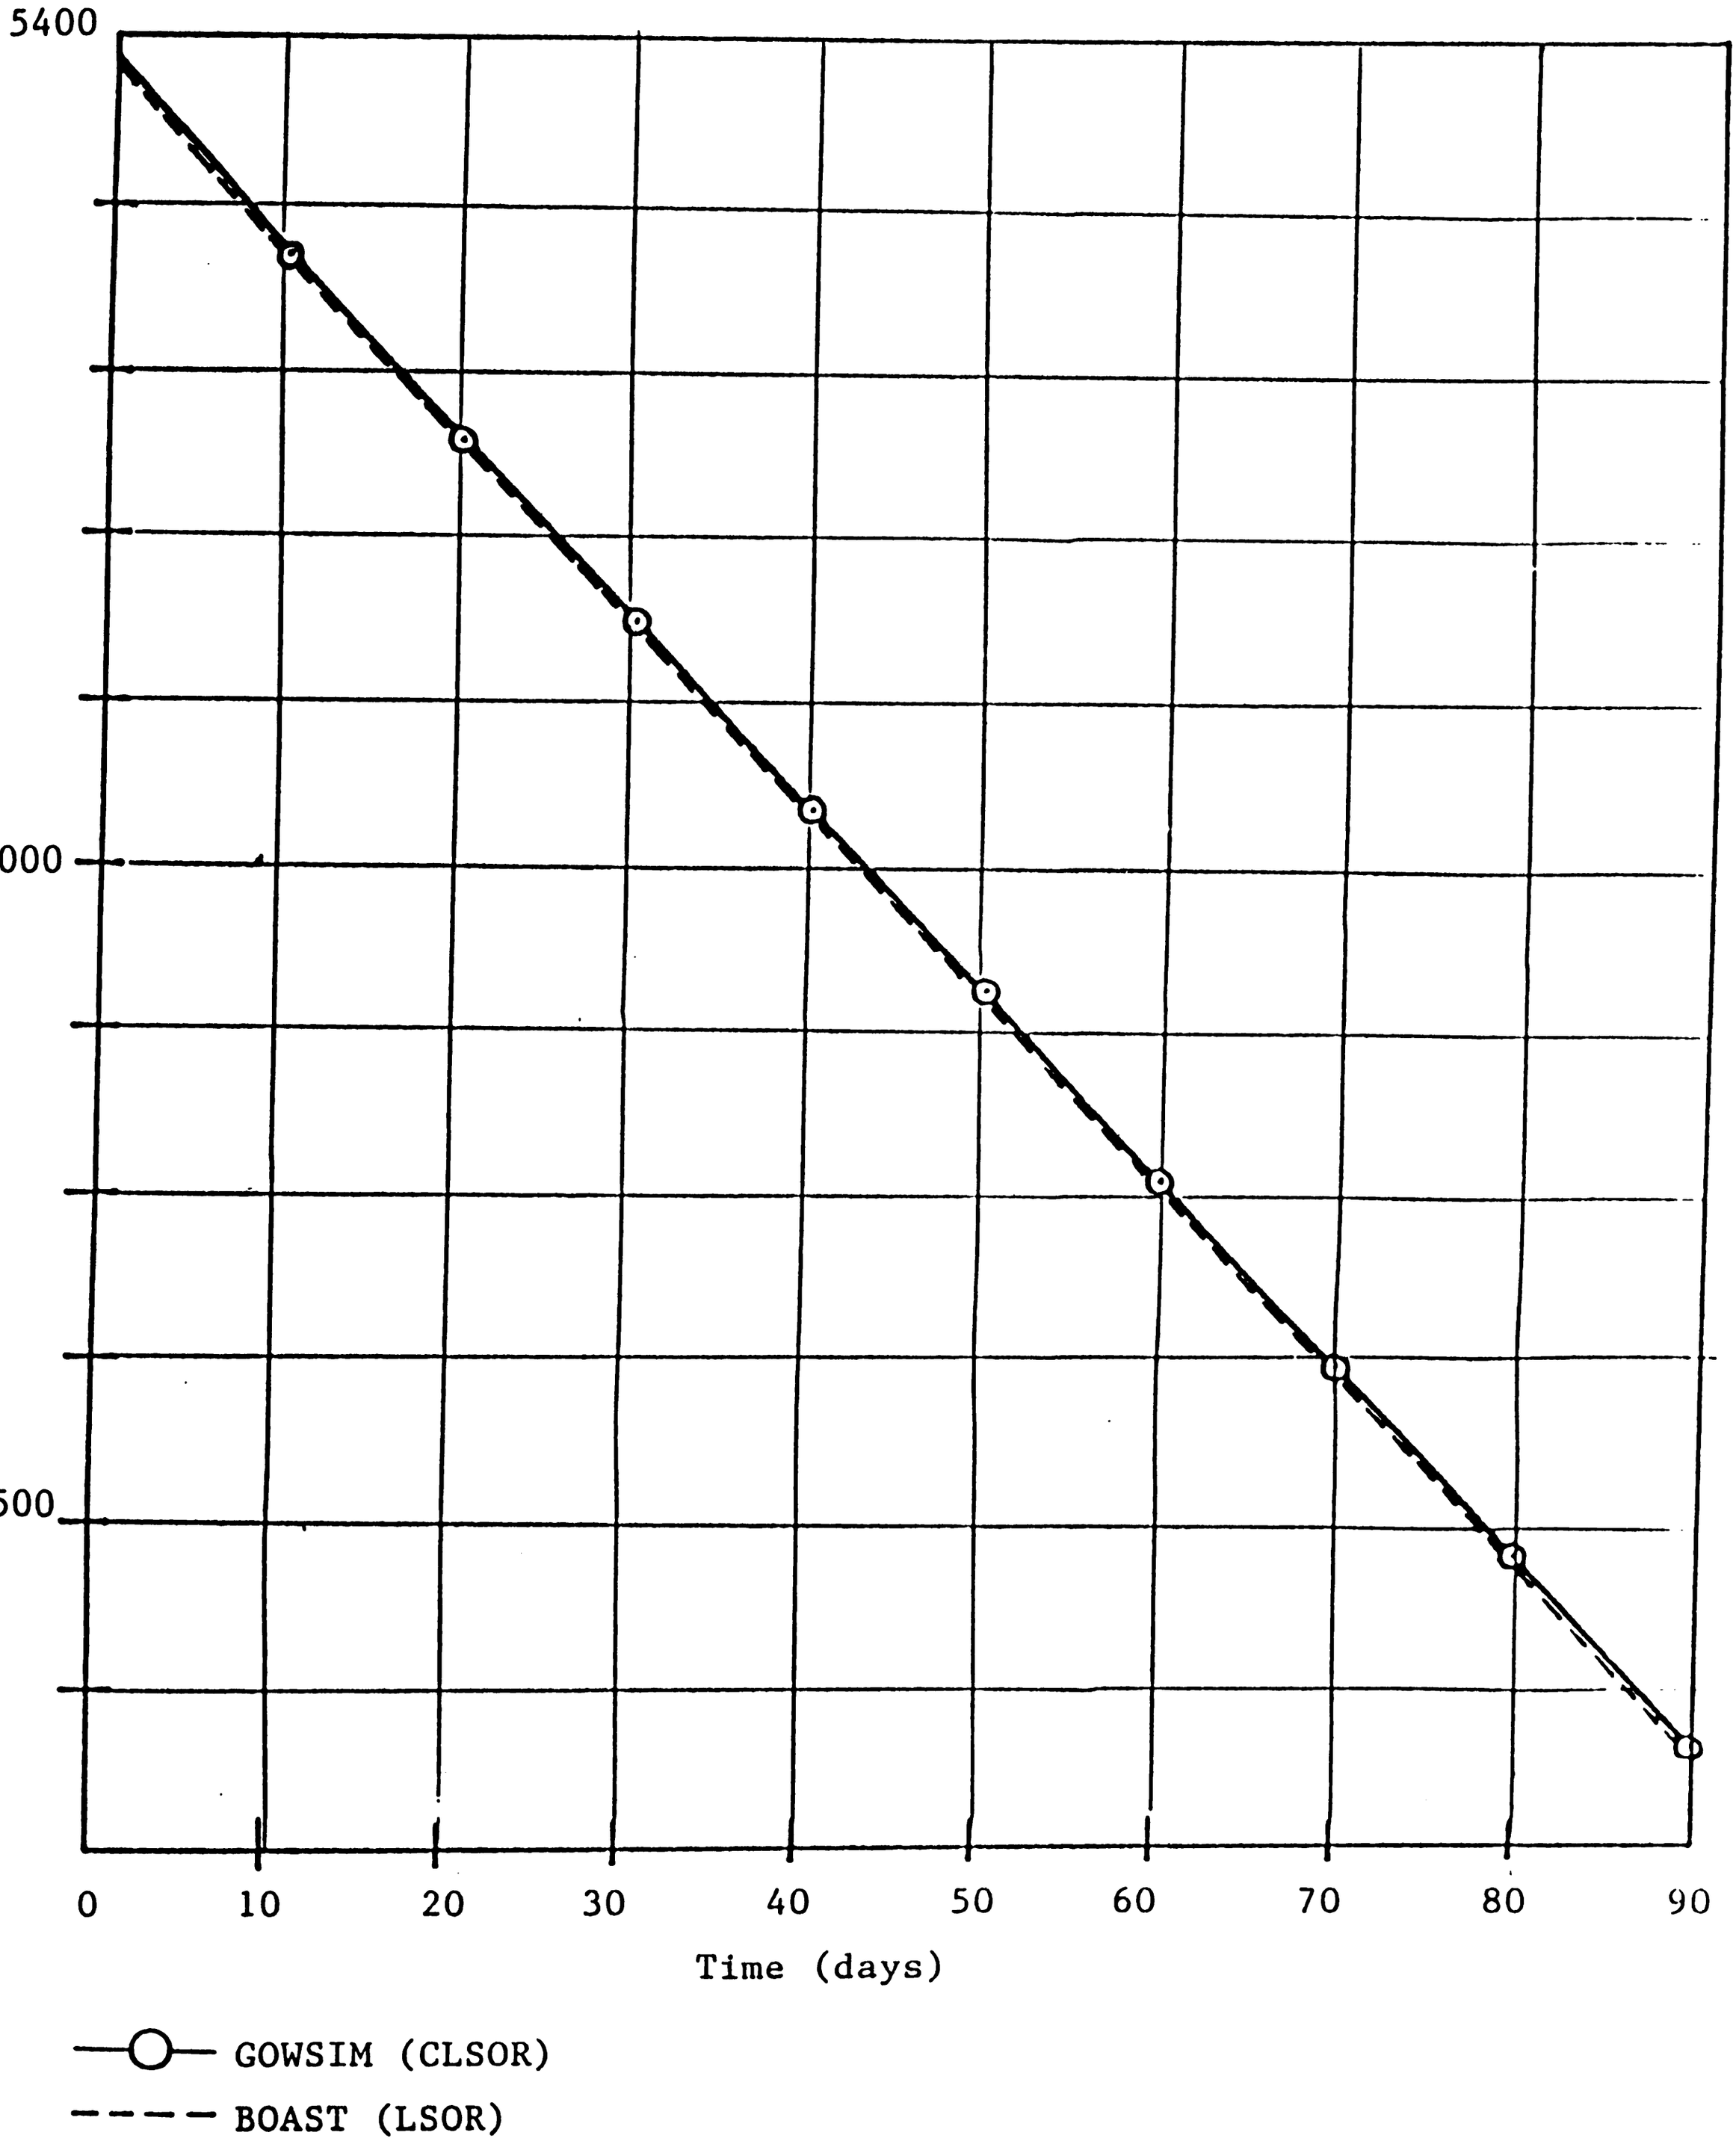
TWO DIMENDIONSAL AREAL MODEL

PRIMARY DEPLETION OF AN UNDERSATURATED RESERVOIR



Problem 3: Cross-Section Model Showing Line-Drive Waterflooding of an Undersaturated Reservoir

A linear, cross-sectional grid model with II = 20, JJ = 1, KK = 5 contains a well at each end of grid block. Production is from a well (I = 20, J = 1) completed in layer 2, 3 and 5 while layer 4 is shut in. The well is under PI and flowing FBHP control at pressure of 4015 psia. Layer 4 is shut in effectively by setting skin's value to a very large number so that PI equals to zero. At the same time, a rate specified water injection well (Q_w = 900 STBD) is completed in layers 4 and 5 at the end (I = 1, J = 1) opposite to the production well location. The complete nature of the problem is illustrated in Fig. (6.5).

An essentially constant oil production rate is maintained in the pressure constrained production well until water-breakthrough occurs. (Fig. 6.6). Breakthrough occurs first in the lowermost layer 5, followed by layer 3 and then the uppermost layer 2. Oil production falls off rapidly after breakthrough. The simulated calculations using BOAST (LSOR) against GOWSIM (CLSOR) are plotted in Fig. (6.6). This shows good agreement except water-breakthrough occurs some days slower for GOWSIM.

Input data for this problem is presented in Table 6.5.

Note: Porosity is halved in the end grid blocks to account for the block-centered finite-difference forumulation. A vertical to horizontal permeability ratio of 0.1 is used so that too much vertical fluid migration is restricted.

Problem 4: Two-Dimensional, x-z Cross-Section Model Showing Production from Oil-Patch and Gas-Patch Reservoirs with Fluid Contact Levels at Different Depths.

In this problem, an oil well and a gas well are producing under a rate constraint of 100 STBD and 10 MSCFD respectively. Oil production is from the well (I = 3, J = 1) completed in the uppermost layer while gas production from the well located at (I = 9, J = 1, K = 1). Equilibrium pressure initializations at constant saturations initialization are made by reading the pressures and saturations block-by-block basis. The oil-water contact and gas-water contact are found at the depths of 8405 ft and 8445 ft respectively. The complete nature of the problem is illustrated in Fig. (6.7). Input data for this problem is presented in Table 6.6. The calculations are plotted in Fig. (6.8) for average reservoir pressure versus time. An approximately constant pressure decline in the reservoir is maintained throughout the time. Care must be taken to use small time steps in this problem.

Problem 5: Linear, Three-Dimensional, Two-Phae Model Showing a Single Gas Well Producing from Gas-Water Reservoir

A linear, three-dimensional model grid (II = 5, JJ = 5, KK = 5) contains a single gas well at the centre of top layer producing under a rate constraint of 25,000 MSCFD. The well production is from layer 1 only. The depth to top of horizontal layer 1 is 8325 ft. The gas-water contact is located at the bottom of layer (2).The complete picture of the problem is illustrated in Fig. (6.9). The performance of a gas-water reservoir with the pertinent data given in Table 6.7 is studied using GWSIM simulator. The reservoir's pressure and temperature are 4800 psia and 180°F respectively. The pressure at the gas-water contact is found to be 4806.6 psia. The input data for this problem is shown in Table 6.8.

The average reservoir pressures after different elapsed times of production are calculated. Then the cummulative gas production verus P/Z are plotted in Fig. (6.10). The straight line nature of the graph clearly states that two-phase gas-water simulator can be used as a single phase reservoir simulator provided that the GWC should be far below the production location.

Problem 6: Two-Dimensional, Cross-Section Model Grid of Gas-Water Reservoir With Two Different Fluid Contact Levels

In this problem, cross section model grid (II = 10, JJ = 1, KK = 3) contains 2 gas wells at the location (3, 1, 1) and (9, 1, 1). The grid dimensions are $\Delta x = 3000'$, $\Delta y = 3000'$, $\Delta z = 50'$. The well located at (3, 1, 1) is under a rate constraint of 10 MSCFD while the other well is under a PI and FBHP control at a pressure of 4000 psia. The well block pressures and saturations are read in block-by-block basis to have two different fluid contact levels in the model grid. The complete picture of the problem is illustrated in Figure (6.11). The input data file for this problem is shown in Table 6.9.

The average reservoir pressures are reported in table and plotted against elapsed time of simulation in Figure (6.12). The method of solution is BAND.

Problem 7: Three-Dimensional Water Reservoir Model

In this problem, three-dimensional model grid (II = 5, JJ = 5, KK = 5) contains 5 water wells of which one well is producing water under a rate constraint of 500 STBD while the rest are injection wells under the PI and FBHP control at a pressure of 4000 psia. The grid dimensions and other pertinent data are shown in Figure (6.13). The input data for this problem is shown in Table (6.10).

Solution method for this problem is BAND. The average reservoir pressure distribution through simulation time is shown in Table (6.11). It is plotted in Figure (6.14).

CONCLUSIONS

Based on the results of simulation of different kinds of models using GOWSIM, GWSIM and WSIM simulators we make the following conclusions:

1. GOWSIM is designed and tested primarily for three-dimensional, three-phase black oil reservoir. GWSIM is better to use for gas reservoir with active water drive. WSIM is used primarily for aquifer model.

2. All of the simulators can be redimensioned painlessly by changing the subsequent parameters in the common block file with no need to compile the source program again.

3. Input data without format can be read eliminating problem to use formatted data file.

4. Simulators contain the direct (BAND) and line successive overrelaxation with additive corrections (CLSOR) methods. We suggest to use BAND algorithm for the model with small number of grid blocks. It runs faster than CLSOR. However, CLSOR is preferred to be used for anisotropic reservoir model with large number of grid blocks.

5. As GOWSIM, GWSIM are primarily a pure IMPES simulator very small time-steps less than 1 day are required in some portions of the run to maintain a stable solution.

6. The GOWSIM, GWSIM programs are easy to use and understand, but still too large to run on a micro-computer system of which we are aware.

C ==========================================================================

C       THE SUBROUTINE CALLS FOR SEVERAL CODES THAT CONTROL DIA-
C       GNOSTIC OUTPUT FOR USE IN PROGRAM DEBUGGING.  THESE CODES
C       ARE NORMALLY ALWAYS SET EQUAL TO ZEROS.  IT ALSO CALLS FOR
C       RUN CONTROL PARAMETERS AND SOLUTION METHOD CONTROL PARA-
C       METERS.

C       NOMENCLATURE:

CC            DPMAX     :  MAXIMUM PRESSURE CHANGE PERMITTED OVER
CC                           A TIME STEP, PSI.
CC                           THE TIME STEP SIZE WILL BE REDUCED BY
CC                           FACT2 IF THE PRESSURE CHANGE IN ANY GRID
CC                           BLOCK EXCEEDS DPMAX DURING A TIME STEP.
CC            DSMAX     :  MAXIMUM SATURATION CHANGE PERMITTED OVER
CC                           A TIME STEP, FRACTION.
CC                           THE TIME STEP SIZE WILL BE REDUCED BY
CC                           FACT2 IF THE SATURATION CHANGE OF ANY
CC                           PHASE IN ANY GRID BLOCK EXCEEDS DSMAX
CC                           DURING A TIME STEP.
CC            FACT1     :  FACTOR FOR INCREASING TIME STEP SIZE UNDER
CC                           AUTOMATIC TIME STEP CONTROL.
CC                           SET FACT1 = 1.0 FOR FIXED TIME STEP SIZE.
CC                           A COMMON VALUE FOR FACT1 IS 1.25.
CC            FACT2     :  FACTOR FOR DECREASING TIME STEP SIZE UNDER
CC                           AUTOMATIC TIME STEP CONTROL.
CC                           SET FACT2 = 1.0 FOR FIXED TIME STEP SIZE.
CC                           A COMMON VALUE FOR FACT2 IS 0.5.
CC            IOCODE    :  CODE FOR INPUT FILE.
C             IHEDIN    :  STORAGE MEMORY FOR INPUT TITLE CARD.
C             KSM1      :  SOLUTION MATRIX DEBUG OUTPUT CONTROL.
C             KSN1      :  LSOR PARAMETER DEBUG OUTPUT CONTROL.
C             KCO1      :  COMPRESSIBILITY AND VOLUME FACTORS DEBUG
CC                           OUTPUT CONTROL.
CC            KSOL      :  SOLUTION METHOD CODE.
C                            KSOL = 1 MEANS 'DIRECT SOLUTION - BAND
CC                           ALGORITHM'.
CC                           KSOL = 2 MEANS 'LSOR METHOD'.
CC                           KSOL = 3 MEANS 'DIRECT SOLUTION - D4
CC                           ALGORITHM'.
C             KTR       :  TRANSMISSIBILITY DEBUG OUTPUT CONTROL.
C             KCOFF     :  DENSITY AND SATURATION DEBUG OUTPUT CONTROL.
C             MITER     :  MAXIMUM NUMBER OF LSOR ITERATIONS PER TIME
CC                           STEP.
CC                           A TYPICAL VALUE FOR MITER IS 250.
C             NN        :  MAXIMUM NUMBER OF TIME STEPS ALLOWED BEFORE
CC                           RUN IS TERMINATED.
C             OMEGA     :  INITIAL LSOR ACCELERATION PARAMETER,
CC                           INITIAL VALUE FOR OMEGA SHOULD BE IN THE
CC                           RANGE 1 AND 2.
CC                           A TYPICAL INITIAL VALUE FOR OMEGA WOULD BE
CC                           1.7.  THE PROGRAM WILL OPTIMIZE OMEGA AS THE
CC                           SOLUTION PROCEEDS.
C             PAMIN     :  LIMITING MINIMUM FIELD AVERAGE PRESSURE,
CC                           PSIA.
C             PAMAX     :  LIMITING MAXIMUM FIELD AVERAGE PRESSURE,
CC                           PSIA.
CC                           RUN WILL BE TERMINATED WHEN AVERAGE RESER-
CC                           VOIR PRESSURE EXCEEDS PAMAX.
C             TMAX      :  MAXIMUM REAL TIME TO BE SIMULATED DURING
CC                           THIS RUN, DAYS.
CC                           RUN WILL BE TERMINATED WHEN TIME EXCEEDS
C                            TMAX.
C             TOL       :  MAXIMUM ACCEPTABLE PRESSURE CHANGE FOR CON-
CC                           VERGENCE OF LSOR ITERATIONS, PSI.
CC                           A TYPICAL VALUE FOR TOL WOULD BE 0.1.
C             TOL1      :  PARAMETER FOR DETERMINING WHEN TO CHANGE
CC                           OMEGA.
CC                           A TYPICAL VALUE FOR TOL1 WOULD BE 0.001.
CC                           IF TOL1 IS SET TO ZERO, THE INITIAL VALUE
CC                           ENTERTED AS OMEGA ABOVE WILL BE USED FOR THE
CC                           ENTIRE RUN.
C             WGRMAX    :  LIMITING MAXIMUM FIELD GAS-WATER RATIO,
C                            SCF/STB.

      SUBROUTINE  GRID1 (II,JJ,KK)

C ================================================================

C     THE SUBROUTINE READS THE NUMBER OF GRID BLOCKS FOR THE SIM-
C     ULATOR IN THREE-DIMENSION GRID SYSTEM, AND ESTABLISHES GRID
C     DIMENSIONS USING THE CONTROL CODES.  THE PROGRAM COULD MOD-
C     IFY TO GRID DIMENSIONS IF NECESSARY.  ALSO CALCULATED ARE
C     NODE MIDPOINT ELEVATIONS OF ALL BLOCKS IN THE MODEL GRID.
```

```
C       NOMENCLATURE:
C
C           DXC           :   A SINGLE CONSTANT VALUE OF X-DIRECTION
CC                            GRID DIMENSION (FT) FOR KDX = -1.
CC                            THE X-DIRECTION GRID DIMENSIONS ARE THE
CC                            SAME FOR ALL BLOCKS IN THE MODEL GRID.
CC          DYC           :   A SINGLE CONSTANT VALUE OF Y-DIRECTION
CC                            GRID DIMENSION (FT) FOR KDY = -1.
CC                            THE Y-DIRECTION GRID DIMENSIONS ARE THE
CC                            SAME FOR ALL BLOCKS IN THE MODEL GRID.
CC          DZC           :   A SINGLE CONSTANT VALUE OF Z-DIRECTION
CC                            GRID DIMENSION (FT) FOR KDZ = -1.
CC                            THE Z-DIRECTION GRID DIMENSIONS ARE THE
CC                            SAME FOR ALL BLOCKS IN THE MODEL GRID.
CC          DX(I,J,K)     :   VARIABLE X-DIRECTION GRID DIMENSION IN FT.
CC                            THE X-DIRECTION GRID DIMENSIONS FOR EVERY
CC                            BLOCK IN LAYER 1 MUST BE READ, AND THEN
C                             ASSIGNED TO ALL OTHER LAYERS IN THE MODEL
CC                            GRID IF KDX = +1.
CC          DY(I,J,K)     :   VARIABLE Y-DIRECTION GRID DIMENSION IN FT.
CC                            THE Y-DIRECTION GRID DIMENSIONS FOR EVERY
CC                            BLOCK IN LAYER 1 MUST BE READ, AND THEN
CC                            ASSIGNED TO ALL OTHER LAYERS IN THE MODEL
CC                            GRID IF KDY = +1.
CC          DZ(I,J,K)     :   VARIABLE Z-DIRECTION GRID DIMENSION IN FT.
CC                            THE Z-DIRECTION DIMENSIONS FOR ALL BLOCKS
CC                            IN THE MODEL GRID MUST BE READ IF KDZ = +1.
CC          ELEV          :   A SINGLE CONSTANT DEPTH VALUE (FT) TO TOP
CC                            OF GRID BLOCKS IN LAYER 1.
CC                            ELEV MUST BE READ IF KEL = 0.
CC          EL(I,J,K)     :   VARIABLE NODE MIDPOINT ELEVATIONS (FT) OF
CC                            ALL BLOCKS IN THE MODEL GRID.
CC          IDCODE        :   PRINT CODE FOR MODIFICATION TO GRID
CC                            DIMENSIONS.
CC                            IDCODE = 0 MEANS 'DO NOT PRINT', AND
CC                            IDCODE = 1 MEANS 'PRINT'.
CC          I             :   X-COORDINATE OF BLOCK TO BE MODIFIED.
CC          II            :   NUMBER OF X-DIRECTION BLOCKS USED IN THE
CC                            MODEL GRID.
CC          IHEDIN(L)     :   STORAGE FOR THE TITLE CARD.
CC          J             :   Y-COORDINATE OF BLOCK TO BE MODIFIED.
CC          JJ            :   NUMBER OF Y-DIRECTION BLOCKS USED IN THE
CC                            MODEL GRID.
CC          K             :   Z-DIRECTION OF BLOCK TO BE MODIFIED.
CC          KK            :   NUMBER OF Z-DIRECTION BLOCKS USED IN THE
C                             MODEL GRID.
CC          KDX           :   CONTROL CODE FOR INPUT OF X-DIRECTION
CC                            GRID DIMENSIONS.
CC          KDY           :   CONTROL CODE FOR INPUT OF Y-DIRECTION
CC                            GRID DIMENSIONS.
CC          KDZ           :   CONTROL CODE FOR INPUT OF Z-DIRECTION
CC                            GRID DIMENSIONS.
CC          NUMDX         :   NUMBER OF GRID BLOCKS WHERE DX IS TO BE
CC                            CHANGED.
CC          NUMDY         :   NUMBER OF GRID BLOCKS WHERE DY IS TO BE
CC                            CHANGED.
CC          NUMDZ         :   NUMBER OF GRID BLOCKS WHERE DZ IS TO BE
CC                            CHANGED.
CC          NX            :   MAXIMUM NUMBER OF X-DIRECTION BLOCKS
CC                            ALLOWED TO USE IN THE MODEL GRID.
CC          NY            :   MAXIMUM NUMBER OF Y-DIRECTION BLOCKS
CC                            ALLOWED TO USE IN THE MODEL GRID.
CC          NZ            :   MAXIMUM NUMBER OF Z-DIRECTION BLOCKS
CC                            ALLOWED TO USE IN THE MODEL GRID.
CC          RDXL(I)       :   VARIABLE X-DIRECTION DIMENSIONS (FT) FOR
CC                            II BLOCKS IN THE FIRST ROW (J=1) OF
CC                            LAYER 1.
CC                            RDXL FOR II BLOCKS MUST BE READ, AND THEN
CC                            ASSIGNED TO ALL OTHER ROWS AND ALL OTHER
CC                            LAYERS IN THE MODEL GRID IF KDX = 0.
CC          RDYL(J)       :   VARIABLE Y-DIRECTION DIMENSIONS (FT) FOR
C                             JJ BLOCKS IN THE FIRST COLUMN (I=1) OF
CC                            LAYER 1.

C ======================================================================
      SUBROUTINE PARM1 (II,JJ,KK)
C ======================================================================
C     THE SUBROUTINE ESTABLISHES THE POROSITY AND PERMABILITY
C     DISTRIBUTIONS IN THE GRID MODEL USING THE CODES FOR COTRO-
C     LLING POROSITY AND PERMEABILITY DATA.  THE PROGRAM COULD
C     MODIFY TO POROSITY AND PERMEABILITY DISTRIBUTIONS IF NECE-
C     SSARY.
C     NOMENCLATURE:
C        IPCODE      :  CONTROL CODE FOR PRINTING MODIFIED POROS-
C                       ITY AND PERMEABILITY DISTRIBUTIONS.
C                       IPCODE = 0 MEANS 'DO NOT PRINT', AND
C                       IPCODE = 1 MEANS 'PRINT'.
C        IHEDIN(L)   :  STORAGE FOR THE TITLE CARD.
C        I           :  X-COORDINATE OF BLOCK TO BE MODIFIED.
C        II          :  NUMBER OF X-DIRECTION BLOCKS USED IN THE
C                       MODEL GRID.
C        J           :  Y-COORDINATE OF BLOCK TO BE MODIFIED.
C        JJ          :  NUMBER OF Y-DIRECTION BLOCKS USED IN THE
C                       MODEL GRID.
C        K           :  Z-COORDINATE OF BLOCK TO BE MODIFIED.
C        KK          :  NUMBER OF Z-DIRECTION BLOCKS USED IN THE
C                       MODEL GRID.
C        KPH         :  CONTROL CODE FOR POROSITY DATA INPUT.
C        KKX         :  CONTROL CODE FOR X-DIRECTION PERMEABILITY
C                       DATA INPUT.
C        KKY         :  CONTROL CODE FOR Y-DIRECTION PERMEABILITY
C                       DATA INPUT.
C        KKZ         :  CONTROL CODE FOR Z-DIRECTION PERMEABILITY
C                       DATA INPUT.
C        KXC         :  A SINGLE CONSTANT VALUE OF X-DIRECTION
C                       PERMEABILITY IN MILLIDARCIES (MD).
C                       KXC IS READ AND ASSIGNED TO ALL BLOCKS IN
C                       THE MODEL GRID IF KKX = -1.
C        KYC         :  A SINGLE CONSTANT VALUE OF Y-DIRECTION
C                       PERMEABILITY IN MILLIDARCIES (MD).
C                       KYC IS READ AND ASSIGNED TO ALL BLOCKS IN
C                       THE MODEL GRID IF KKY = -1.
C        KZC         :  A SINGLE CONSTANT VALUE OF Z-DIRECTION
C                       PERMEABILITY IN MILLIDARCIES (MD).

      SUBROUTINE UINIT1 (KPI,II,JJ,KK,CUMPW,MBEW,CUMPG,MBEG,
     $                   SWC,GWC,PGWC,CUMIW,CUMIG)
C ================================================================
C
C     THE SUBROUTINE CALLS FOR TWO OPTIONS OF PRESSURE AND SAT-
C     URATION INITIALIZATION. THE INITIAL PRESSURE DISTRIBUTION
C     CAN EITHER BE CALCULATED BY THE PROGRAM FOR EQUILIBRIUM
C     CONDITIONS GIVEN THE LOCATION OF THE GAS/WATER CONTACT AND
C     THE PRESSURE AT THE CONTACT, OR THE INITIAL PRESSURE
C     DISTRIBUTION CAN BE READ ON A BLOCK-BY-BLOCK BASIS. THE
C     SATURATIONS (SW,SG) CAN EITHER BE READ AS CONSTANT VALUES
C     OVER THE ENTIRE GRID, OR THE ENTIRE SW AND SG DISTRIBUTIONS
C     ARE READ ON A BLOCK-BY-BLOCK BASIS.
C
C     NOMENCLATURE:
C
C        BBG ...       :  GAS FORMATION VOLUME FACTOR AT PRESSURE,
C                         PGWC IN RCF/SCF.
C        BBW           :  WATER FORMATION VOLUME FACTOR AT PRESSURE,
C                         PGWC IN RB/STB.
C        BGT           :  VARIABLE GAS FORMATION VOLUME FACTOR AT
C                         PRESSURE, PGT IN PVT DATA TABLE.
C        BWT           :  VARIABLE WATER FORMATION VOLUME FACTOR AT
C                         PRESSURE, PWT IN PVT DATA TABLE.
C        CUMIW         :  CUMMULATIVE WATER INJECTION, STB.

      SUBROUTINE  QRATE (NVQN)

C ======================================================================

C     THIS SUBROUTINE CALCULATES THE LAYERED FLOW RATES OF THE
C     INDIVIDUAL PHASES FOR THE WELL UNDER RATE CONSTRAINT, AND
C     THEN DETERMINES THE FLOWING BOTTOM-HOLE PRESSURE OF THAT
C     WELL.     IF THE WELL IS UNDER PID AND FBHP CONTROL, IT
C     CALCULATES THE LAYERED FLOW RATES OF THE INDIVIDUAL PHASES
C     FOR EXPLICIT PRESSURE CALCULATION.

C     NOMENCLATURE :

C       ALPHAW      : GMW/GMT
C       ALPHAG      : GMG/GMT
C       GMG         : KRG/MUG
C       GMW         : KRW/MUW
C       GMT         : GMG+GMW
C       IQ1         : IQN1(I,J,K)

      SUBROUTINE TABLE

C ==========================================================================

C     THE SUBROUTINE ESTABLISHES THE RELATIVE PERMEABILITY AND
C     CAPILLARY PRESSURE TABLES, AND FLUID PVT DATA TABLES.

C     NOMENCLATURE:

C          BWT(L)     :  VARIABLE WATER FORMATION VOLUME FACTOR
C                        VALUE, RB/STB.
C          BGT(L)     :  VARIABLE GAS FORMATION FACTOR VALUE,
C                        RCF/SCF.
C          BWPT(L)    :  SLOPE dBW/dP.
C                        BWPT IS CALCULATED AS (BWT(L)-BWT(L-1))/
C                        (PWT(L)-PWT(L-1)).
C          BGPT(L)    :  SLOPE dBG/dP.
C                        BGPT IS CALCULATED AS (BGT(L)-BGT(L-1))/
C                        (PGT(L)-PGT(L-1)).
C          CRT(L)     :  PRESSURE DEPENDENT ROCK COMPRESSIBILITY,
C                        /PSIA.
C          IHEDIN(L)  :  STORAGE MEMORY FOR INPUT TITLE CARD.
C          L          :  COUNT NUMBER.
C          KRGT(L)    :  GAS PHASE RELATIVE PERMEABILITY
C          KRWT(L)    :  WATER PHASE RELATIVE PERMEABILITY.
C          MSAT       :  MAXIMUM NUMBER OF ENTRY VALUE FOR PHASE
C                        SATURATION.
C          MUWT(L)    :  WATER VISCOSITY, CENTIPOISES.
C          MPWT       :  MAXIMUM NUMBER OF ENTRY VALUE FOR WATER
C                        PHASE PRESSURE, PSIA.
C          MUGT(L)    :  GAS VISCOSITY, CPS.
C          MPGT       :  MAXIMUM NUMBER OF ENTRY VALUE FOR GAS
C                        PHASE PRESSURE, PSIA.
C          NTE        :  MAXIMUM NUMBER OF DATA ENTRY ALLOWED IN
C                        ALL PVT TABLES.
C          PCGWT(L)   :  GAS/WATER CAPILLARY PRESSURE, PSI.
C          PMAXT      :  MAXIMUM PRESSURE ENTRY IN ALL PVT TABLES,
C                        PSIA.
C          PWT(L)     :  WATER PHASE PRESSURE, PSIA.
C                        THE LAST ENTRY OF PWT IN THE TABLE MUST
C                        BE PMAXT.
C          PGT(L)     :  GAS PHASE PRESSURE, PSIA.
C                        THE LAST ENTRY OF PGT IN THE TABLE MUST
C                        BE PMAXT.
C          RSWT(L)    :  GAS IN WATER SOLUTION RATIO, SCF/STB.
C          RHOSCW     :  STOCK TANK WATER DENSITY, LB/CU FT.
C          RHOSCG     :  GAS DENSITY AT STANDARD CONDITIONS,
C                        LB/CU FT.
C          RSWPT(L)   :  SLOPE dRSW/dP.
C                        RSWPT IS CALCULATED AS (RSWT(L)-RSWT(L-1))
C                        /(PWT(L)-PWT(L-1)).
C          SAT(L)     :  VALUE OF PHASE SATURATION IN FRACTION.
C                        FIRST ENTRY OF SAT SHOULD BE -0.10, AND
C                        THE LAST ENTRY MUST BE 1.10.
C                        SAT REFERS TO THE SATURATION OF EACH PAR-
C                        TICULAR PHASE. FOR EXAMPLE, SAT=0.2 MEANS
C                        KRWT WOULD REFER TO WATER RELATIVE PERM-
C                        EABILITY IN THE PRESENCE OF 20 PERCENT
C                        WATER SATURATION, KRGT(20% GAS SATURATION)
C                        AND PCGWT(20% GAS SATURATION).
